

neutrino astrophysics & galactic cosmic ray anisotropy in IceCube

Paolo Desiati

desiati@icecube.wisc.edu

February 6, 2010

University of Wisconsin - Madison

the IceCube Collaboration

36 institutions in 4 continents

IceCube Observatory

► IceCube

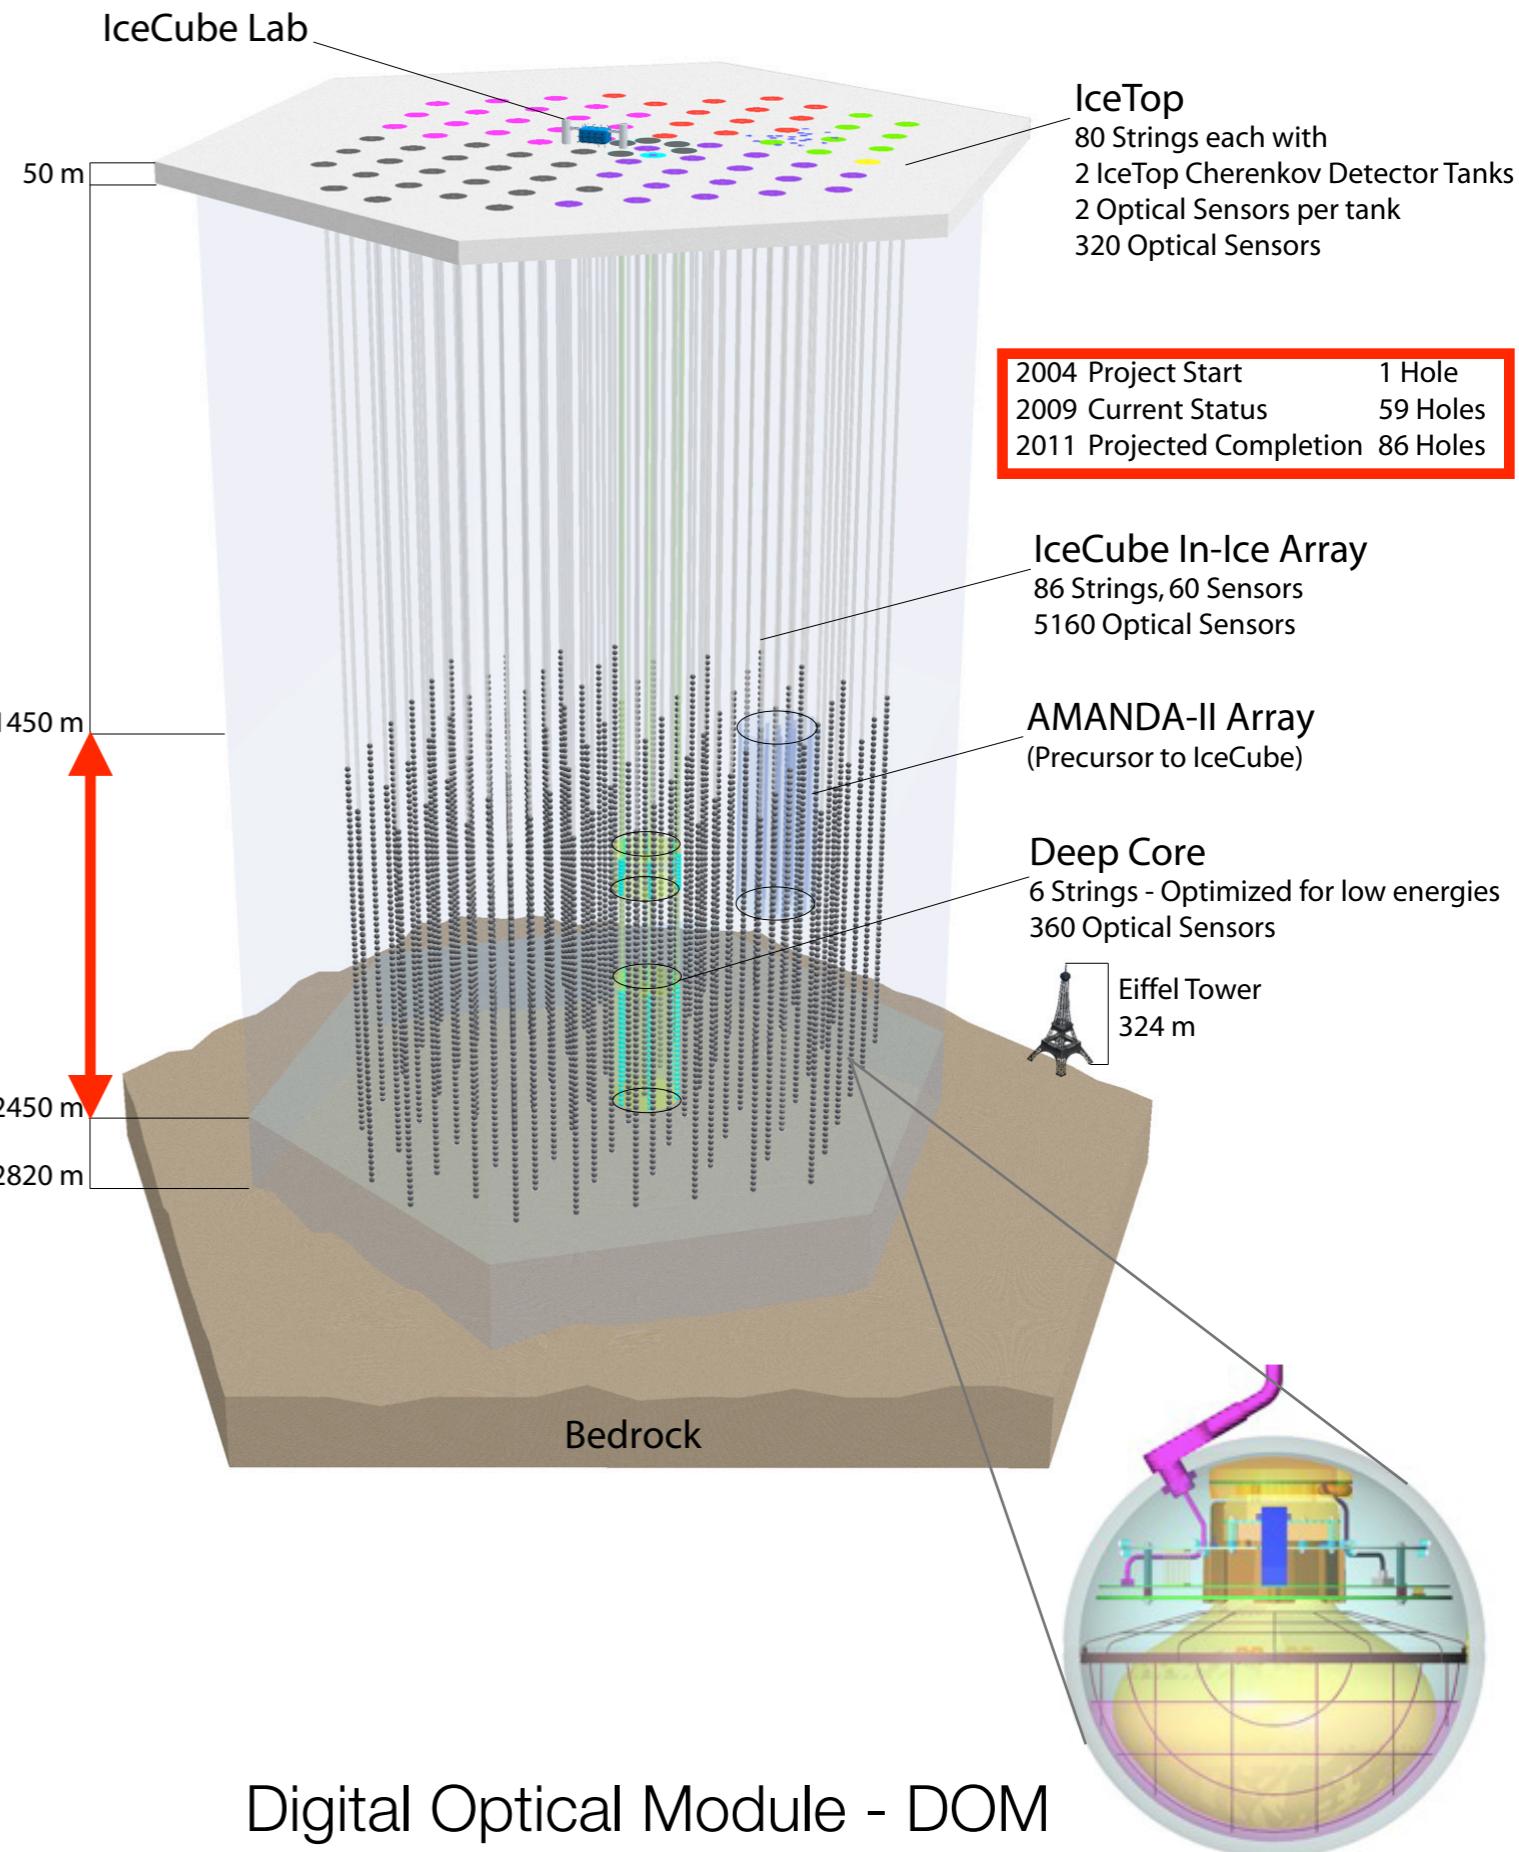

- physics run with 59 strings
- currently 79 strings
- 86 strings in 2011
- 125 m inter-string spacing
- 17 m DOM distance

► taking data during construction

► AMANDA decommissioned on May 11, 2009

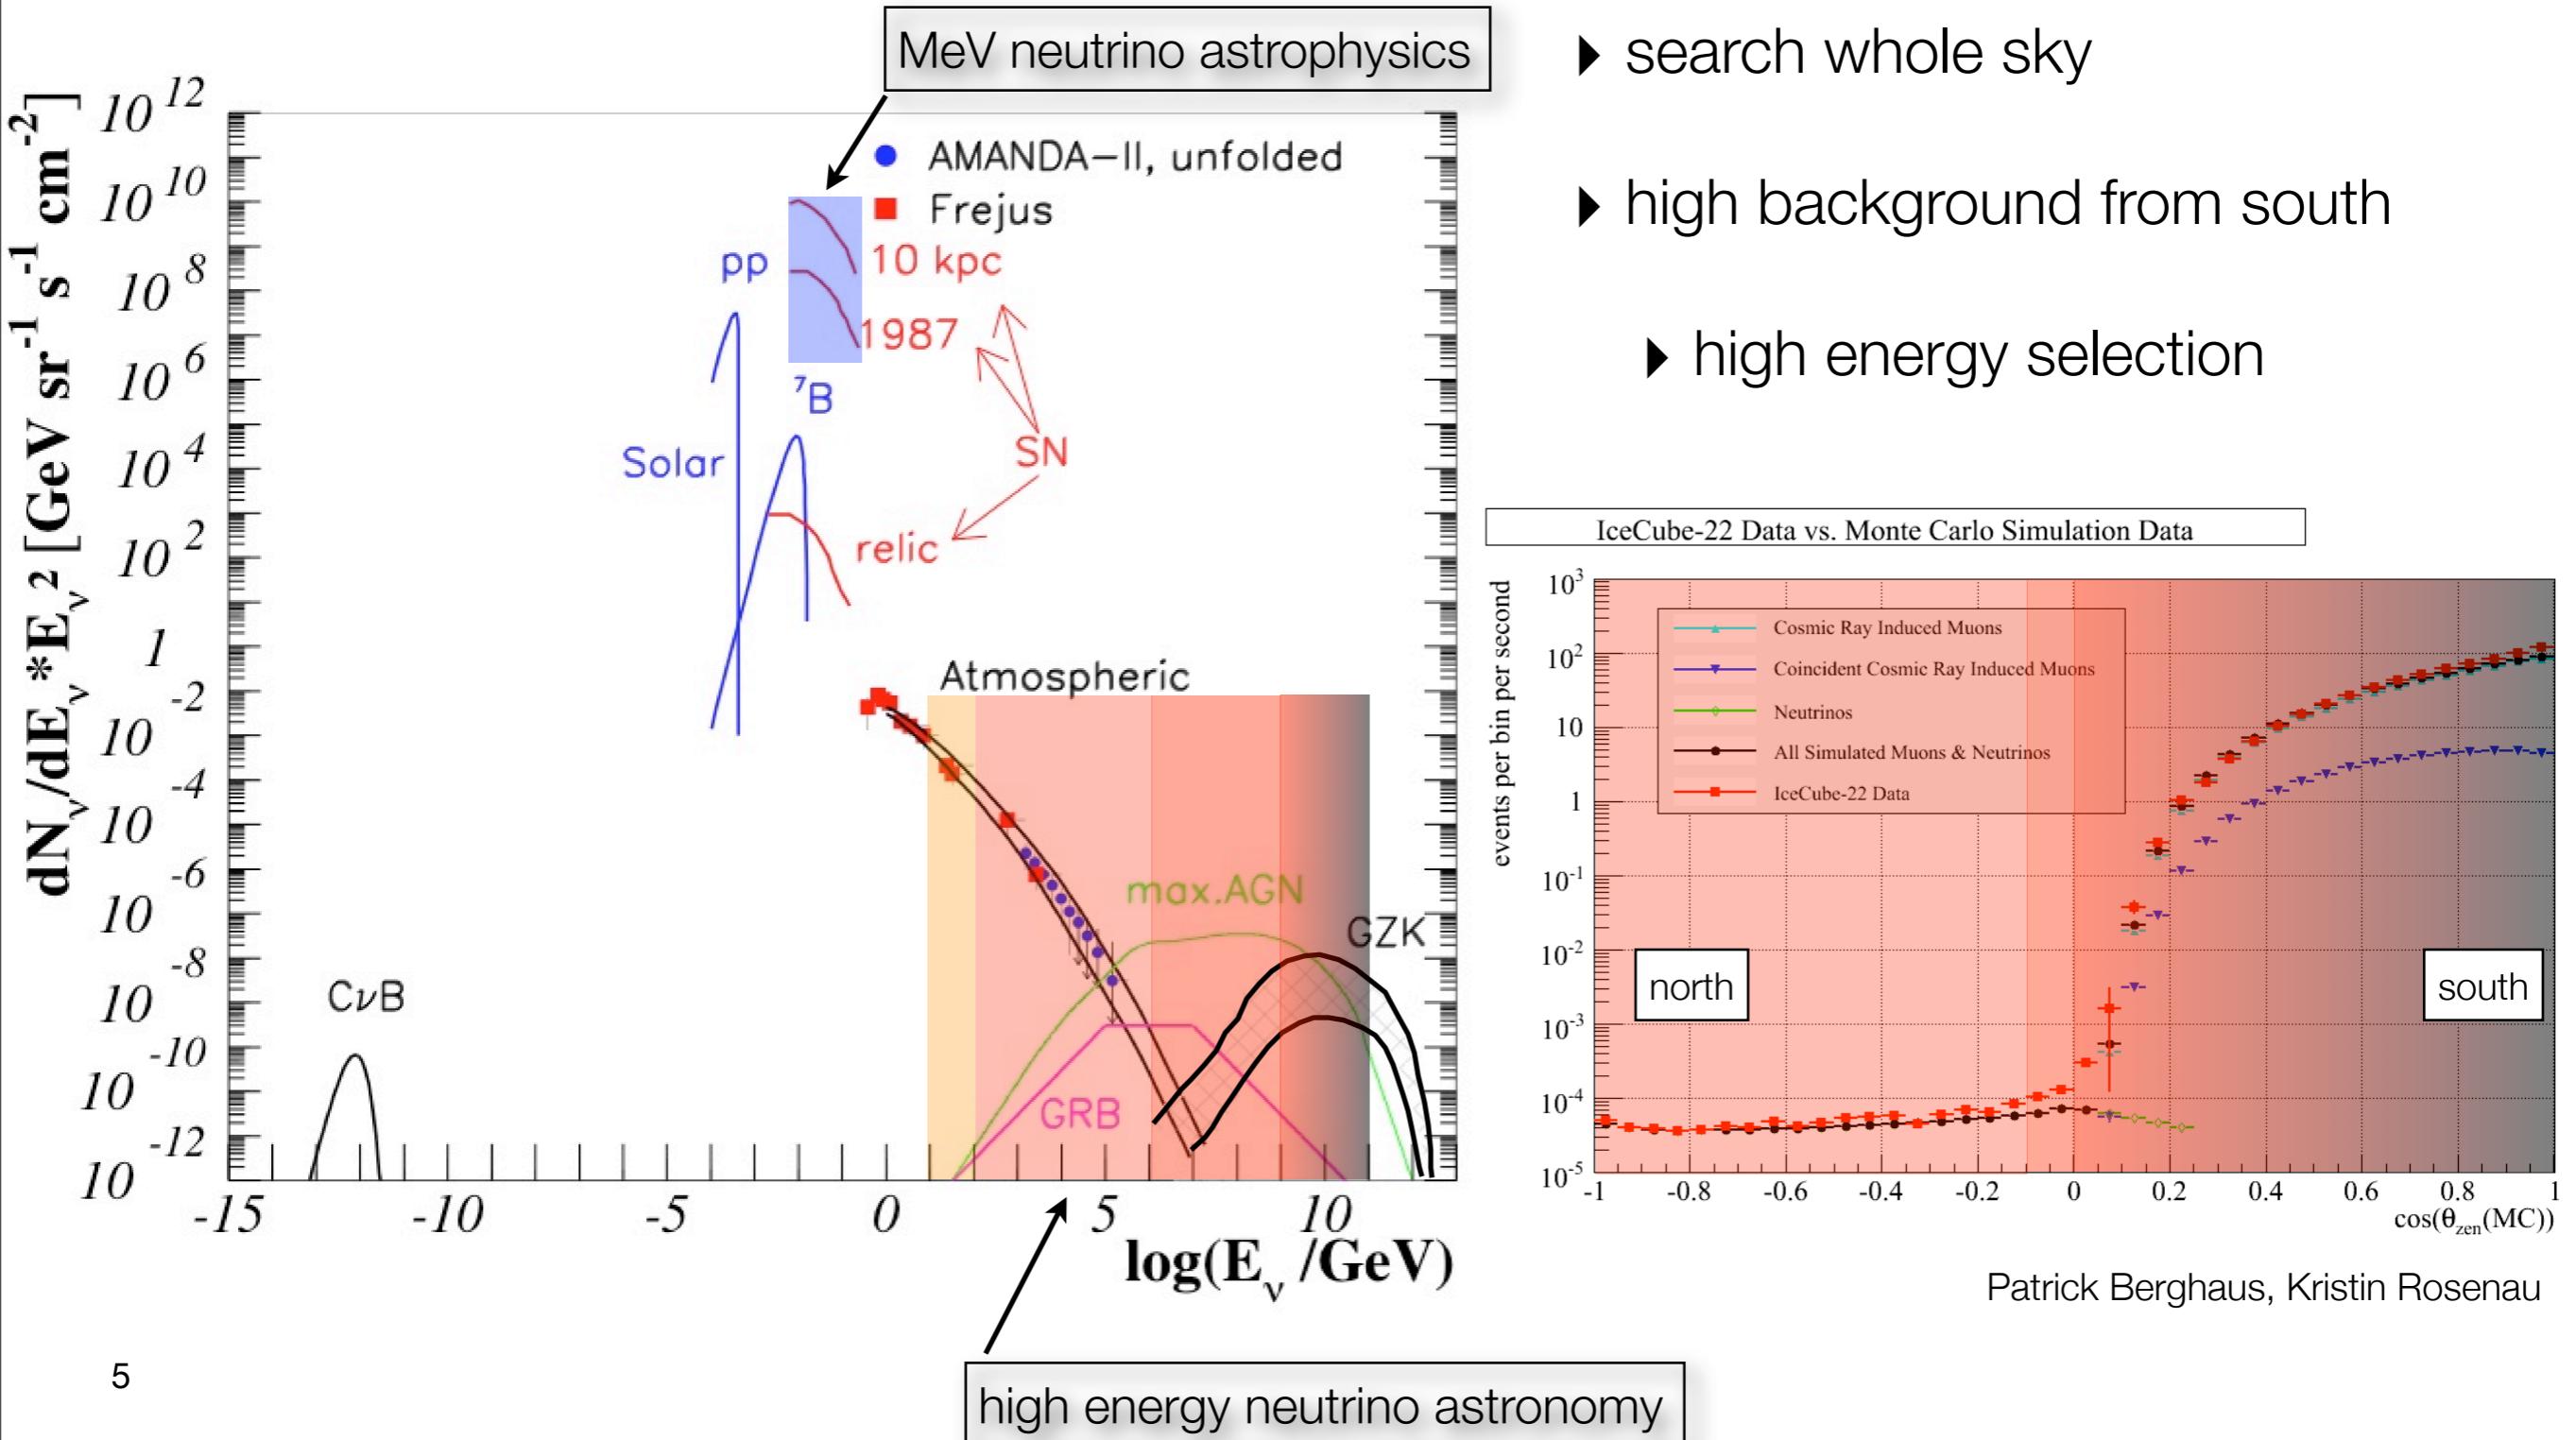

► Deep Core completed with 6 strings

IceCube

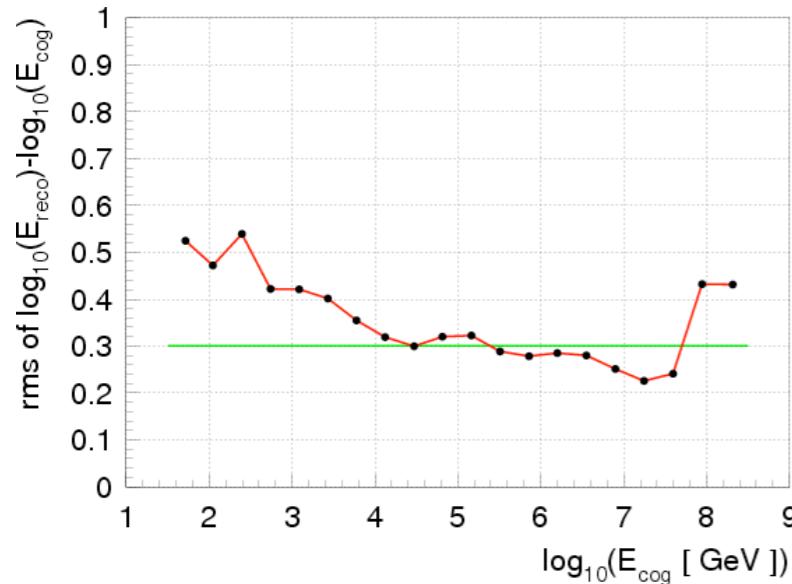

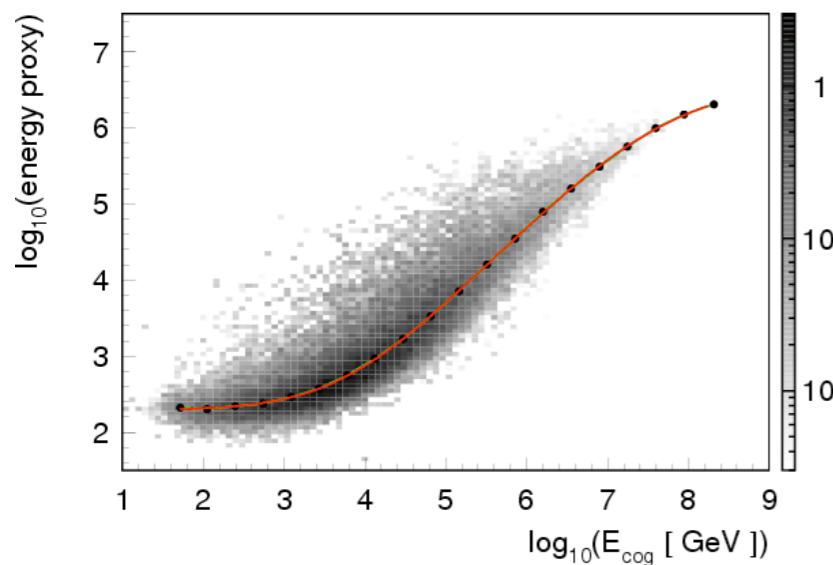

high energy neutrino astronomy

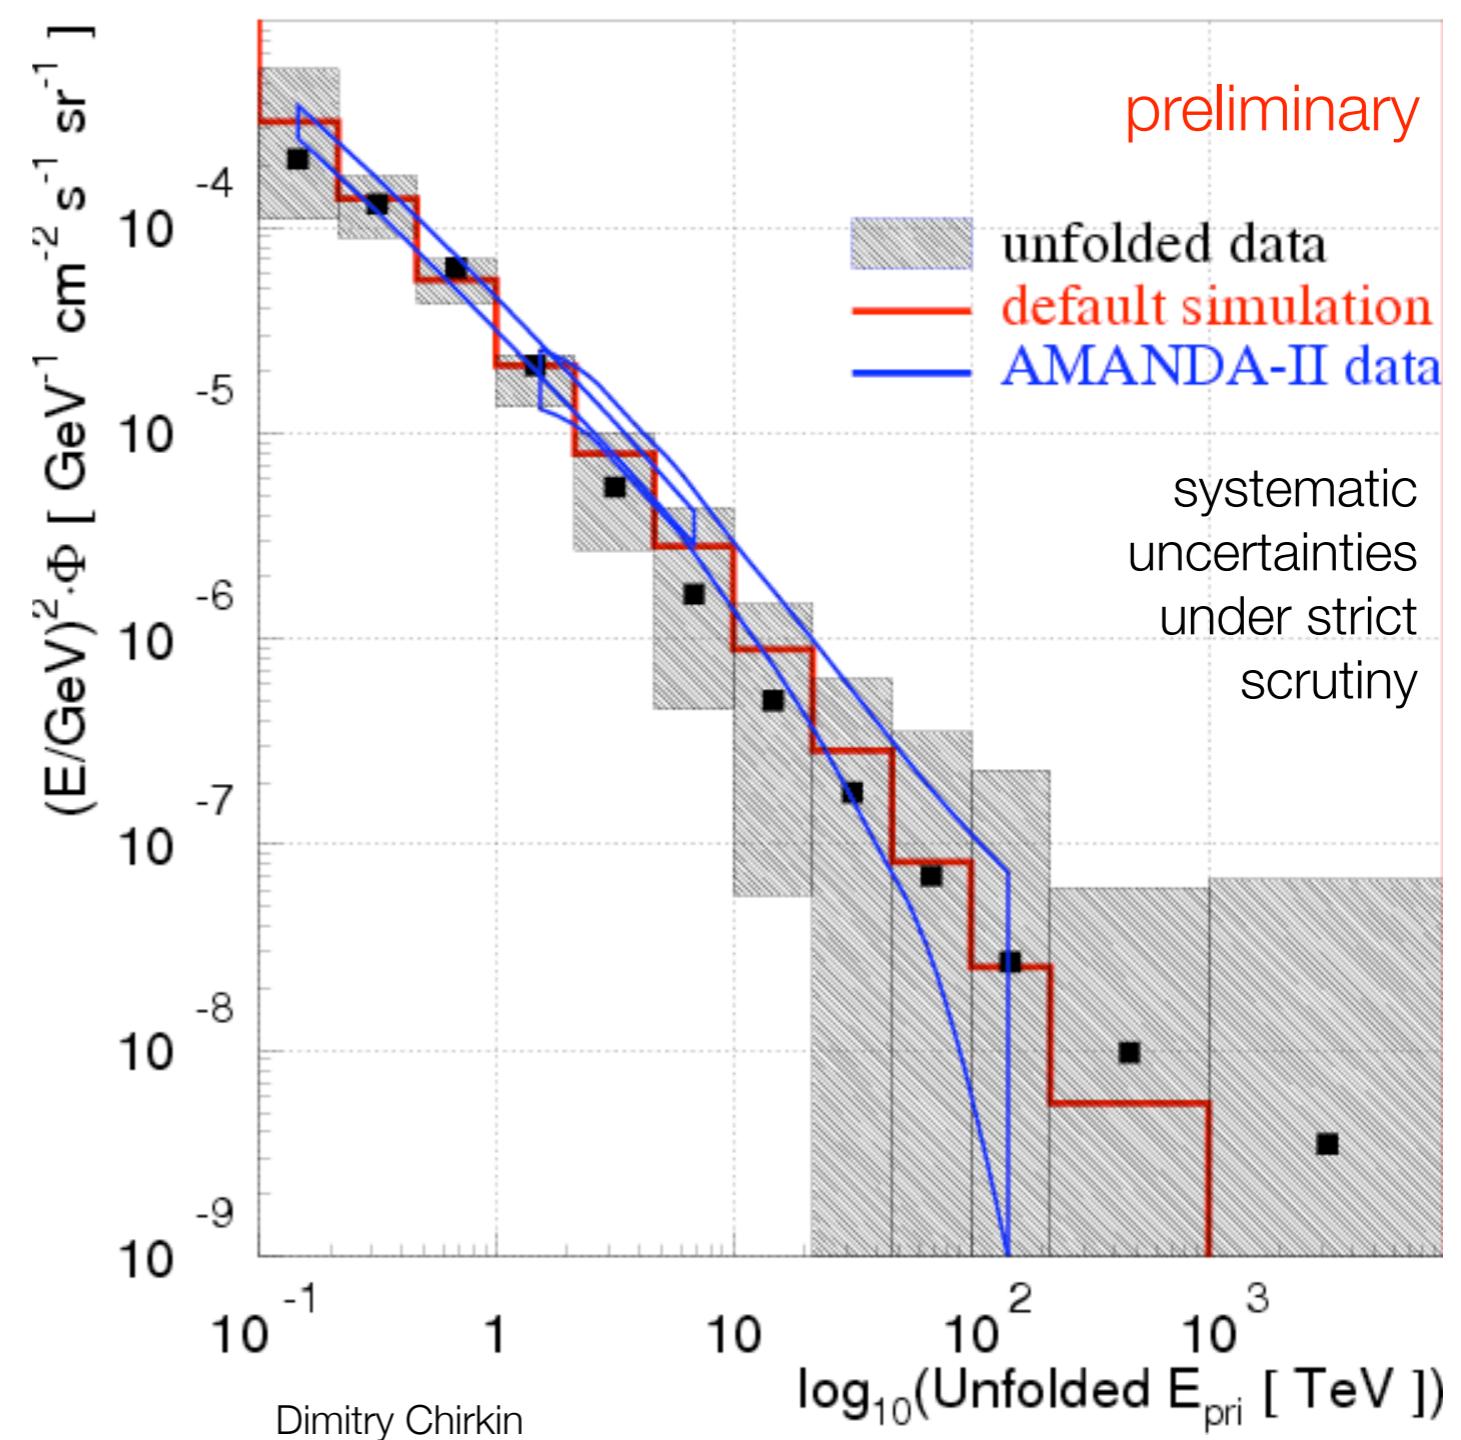

atmospheric neutrinos

IceCube 22 strings (2007)
unfolded atmospheric ν_μ spectrum

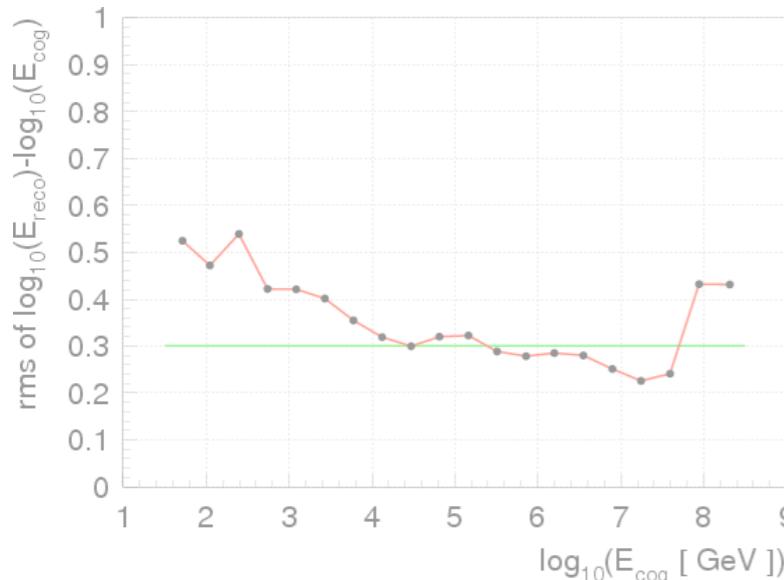

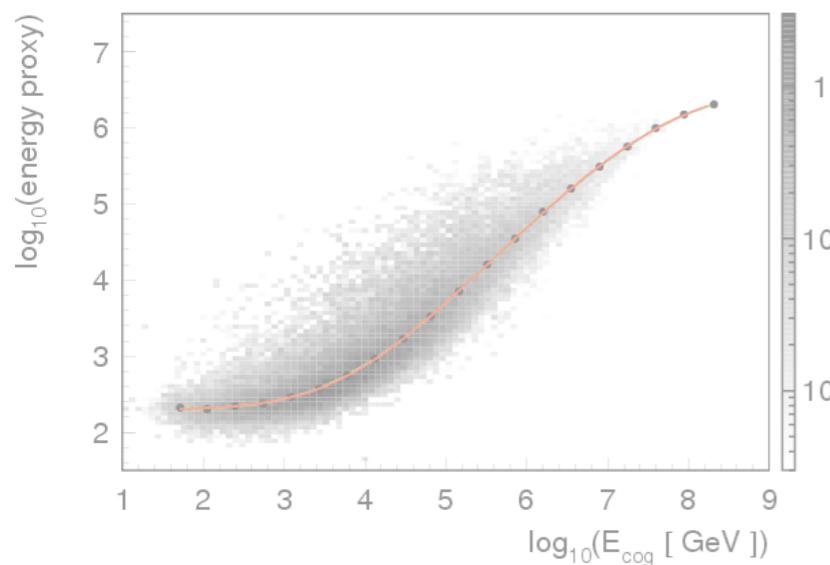

energy estimation resolution

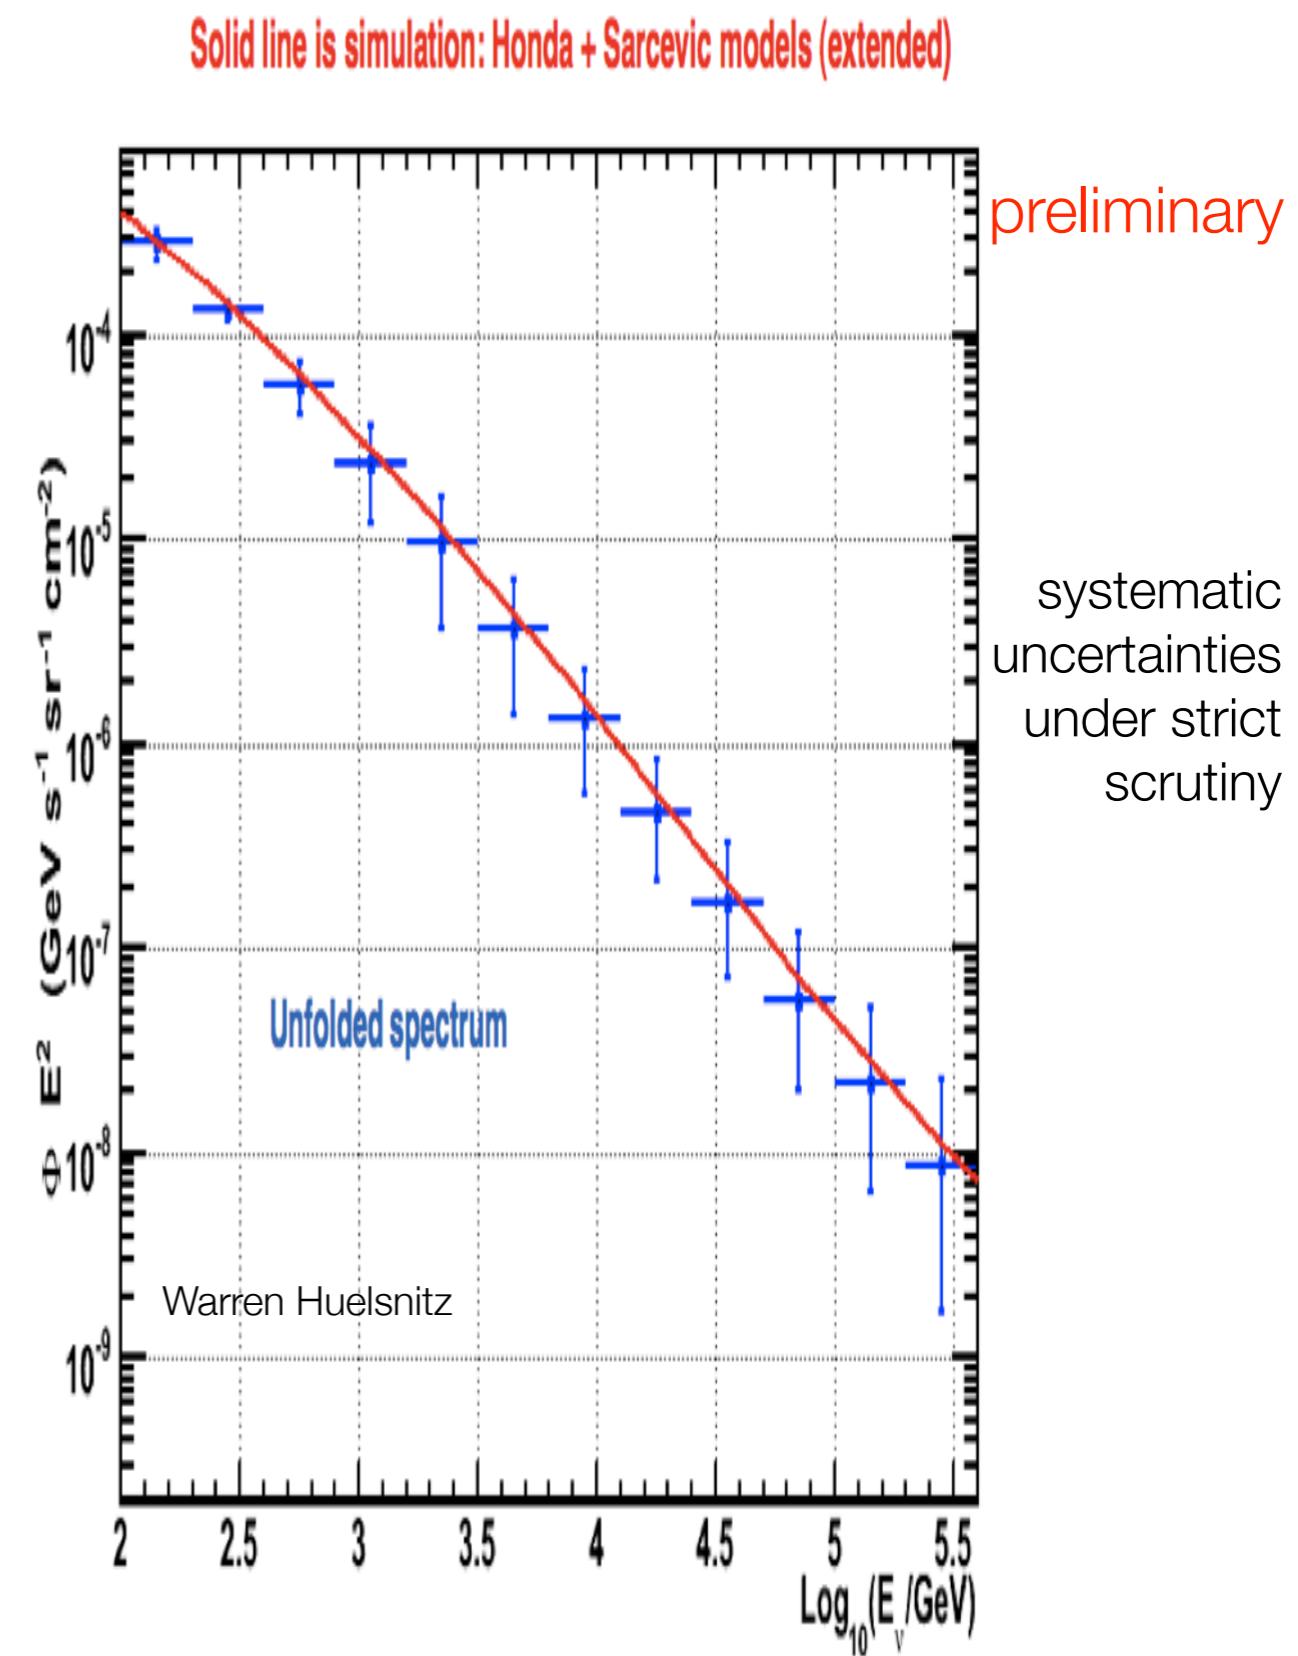

Dimitry Chirkin

atmospheric neutrinos

IceCube 40 strings (2008)
unfolded atmospheric ν_μ spectrum

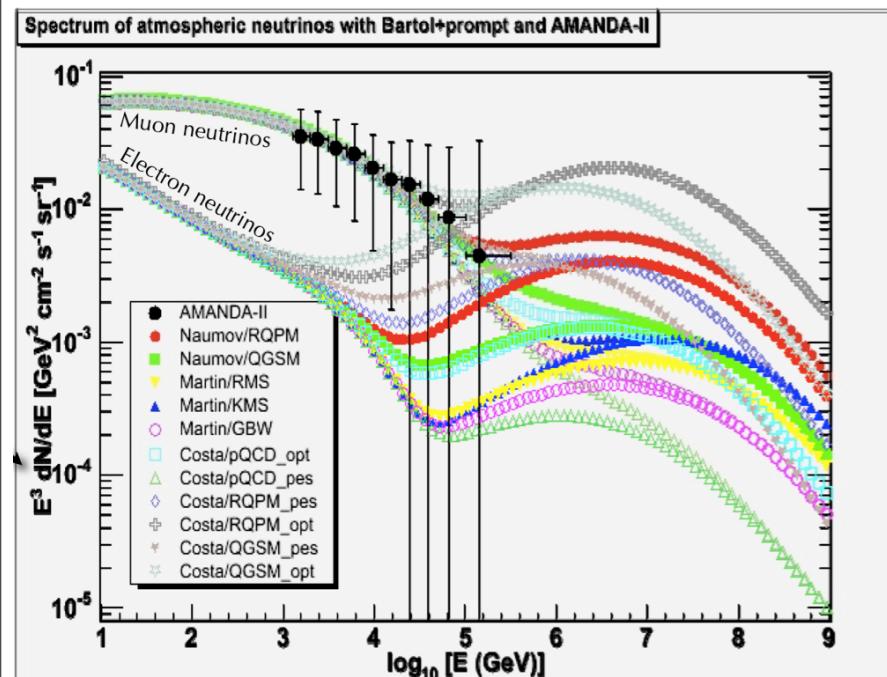

energy estimation resolution

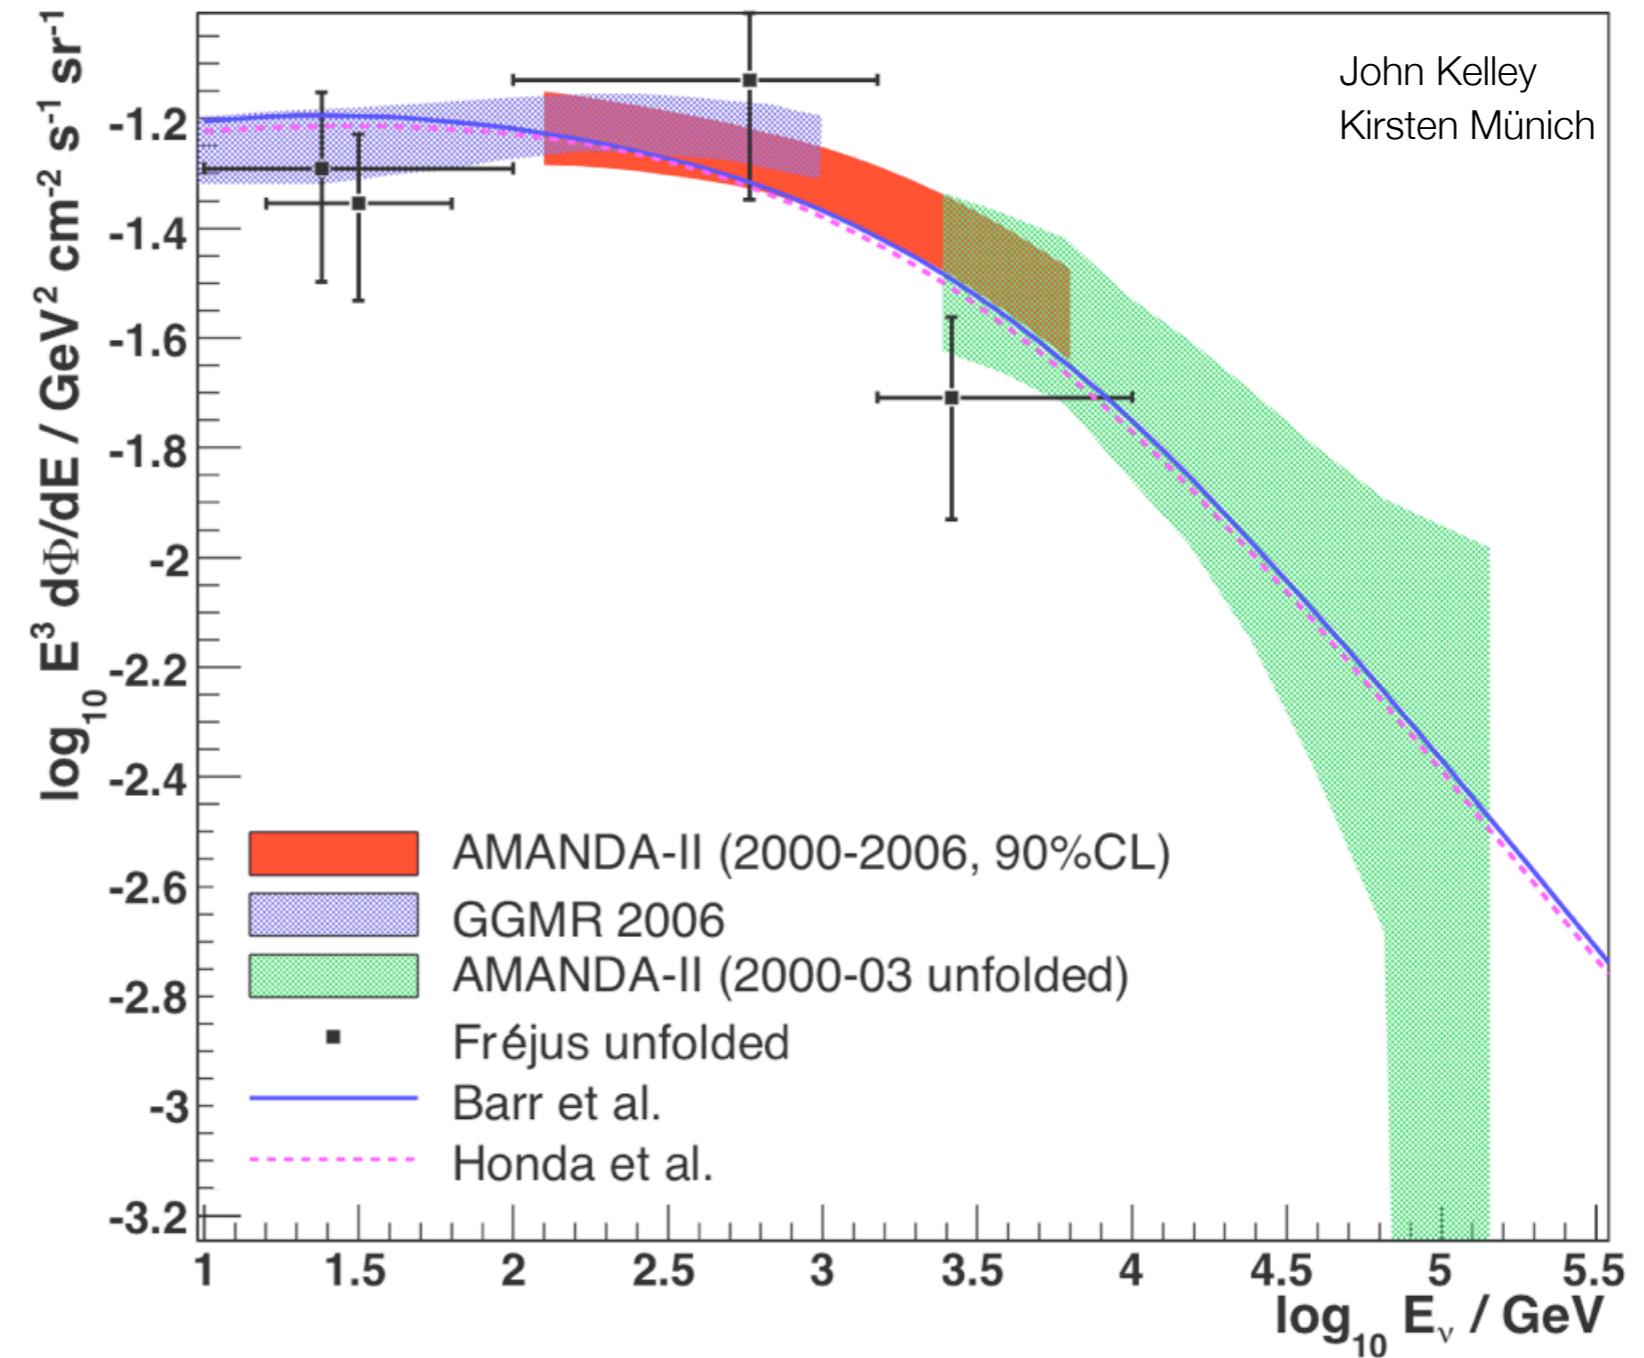

atmospheric neutrinos

unfolded atmospheric ν_μ spectrum

high energy neutrinos from
charm

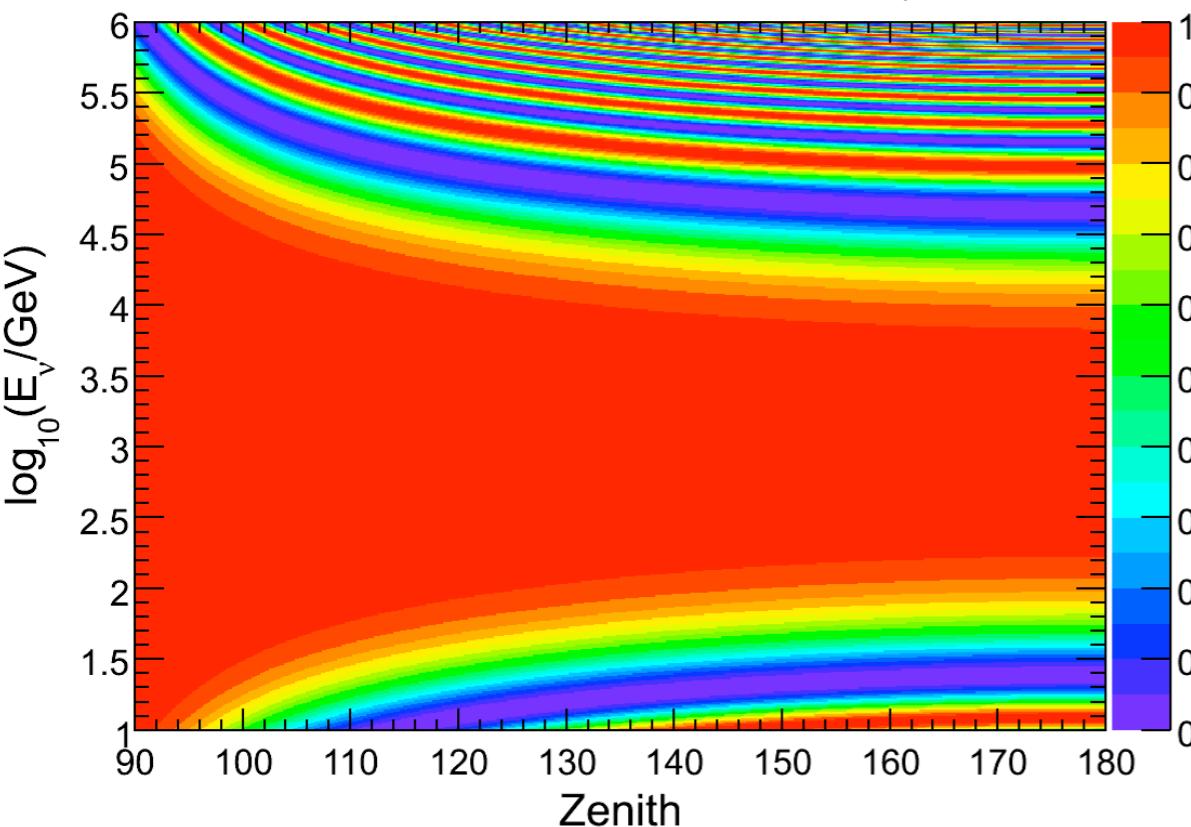

Abbasi et al., Phys. Rev. D 79, 102005 (2009), arXiv:0902.0675

atmospheric neutrinos & non-standard oscillations

Abbasi et al., Phys. Rev. D 79, 102005 (2009), arXiv:0902.0675

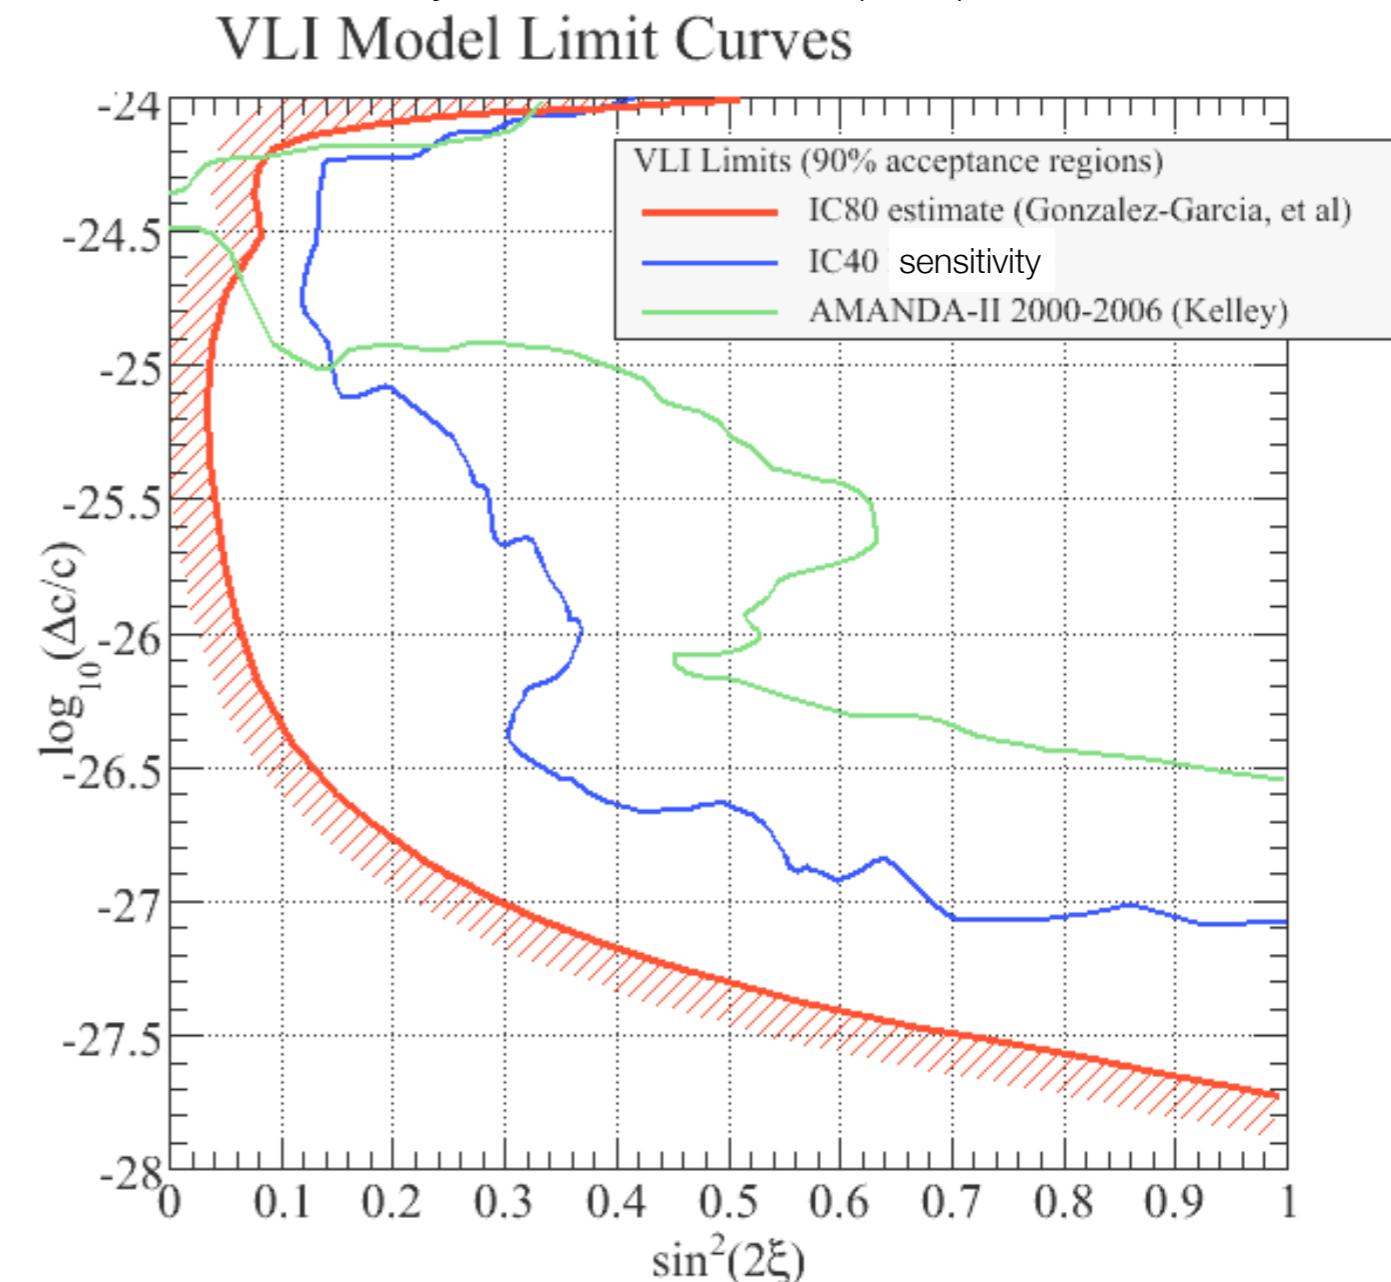

Violation of Lorentz Invariance

$$\frac{\delta c}{c} = 10^{-27}$$
$$\sin^2 2\theta_c = 1$$

González-García, Halzen, and Maltoni, PRD 71, 093010 (2005)

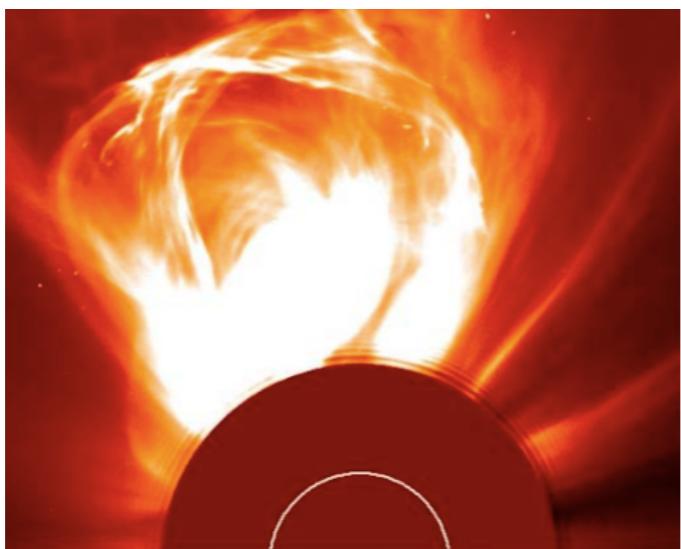

John Kelley (IC22) - Warren Huelsnitz (IC40)

- **IC40 preliminary** : systematic uncertainties affecting energy/angular shape under scrutiny
- will constrain VLI, QD, and other models

sources of astrophysical neutrinos

solar shock acceleration
well known

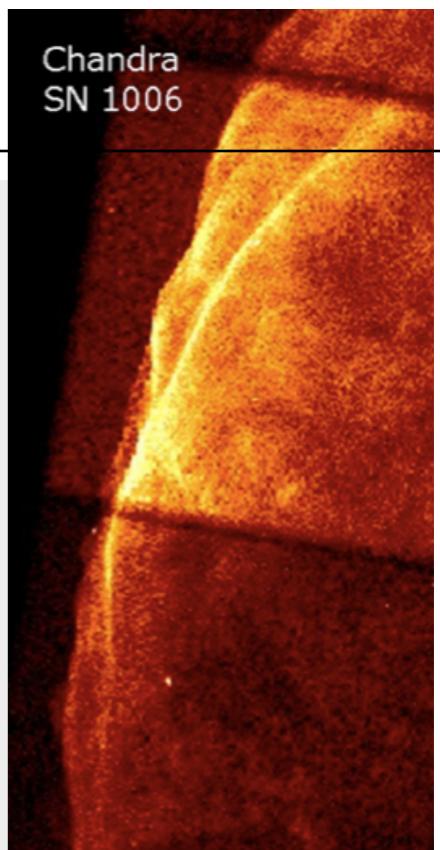

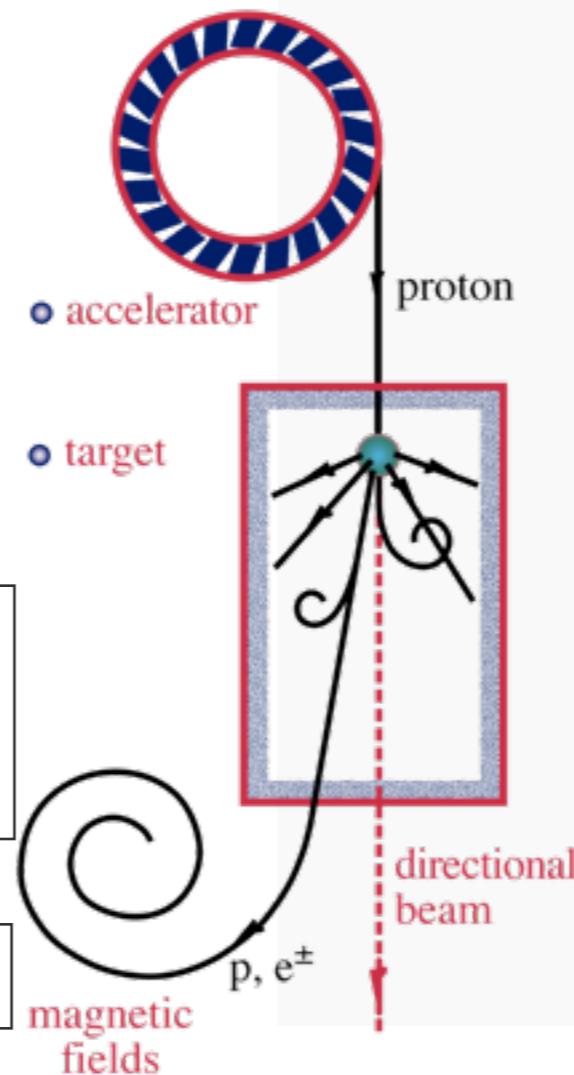

$p + (p \text{ or } \gamma) \rightarrow \pi^\pm + X \rightarrow \nu_e, \nu_\mu + X$ neutrinos ...
 $\rightarrow \pi^0 + X \rightarrow \gamma\gamma + X$ gamma rays ...

Flux $\sim E_p^{-2}$ (Fermi acceleration)

protons @ knee produce $\sim 300 \text{ TeV}$ γ rays

observed shocks in SNR

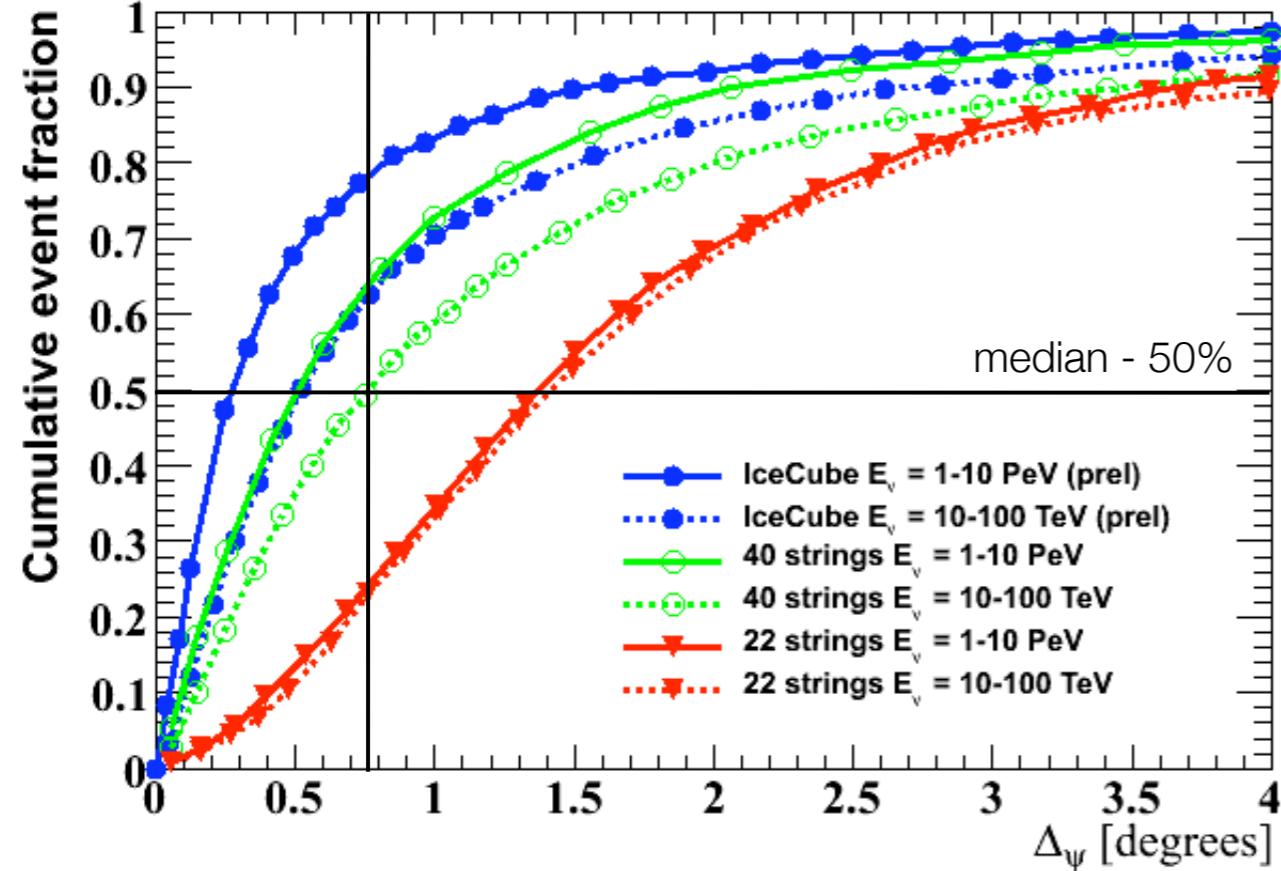

NEUTRINO BEAMS: HEAVEN & EARTH

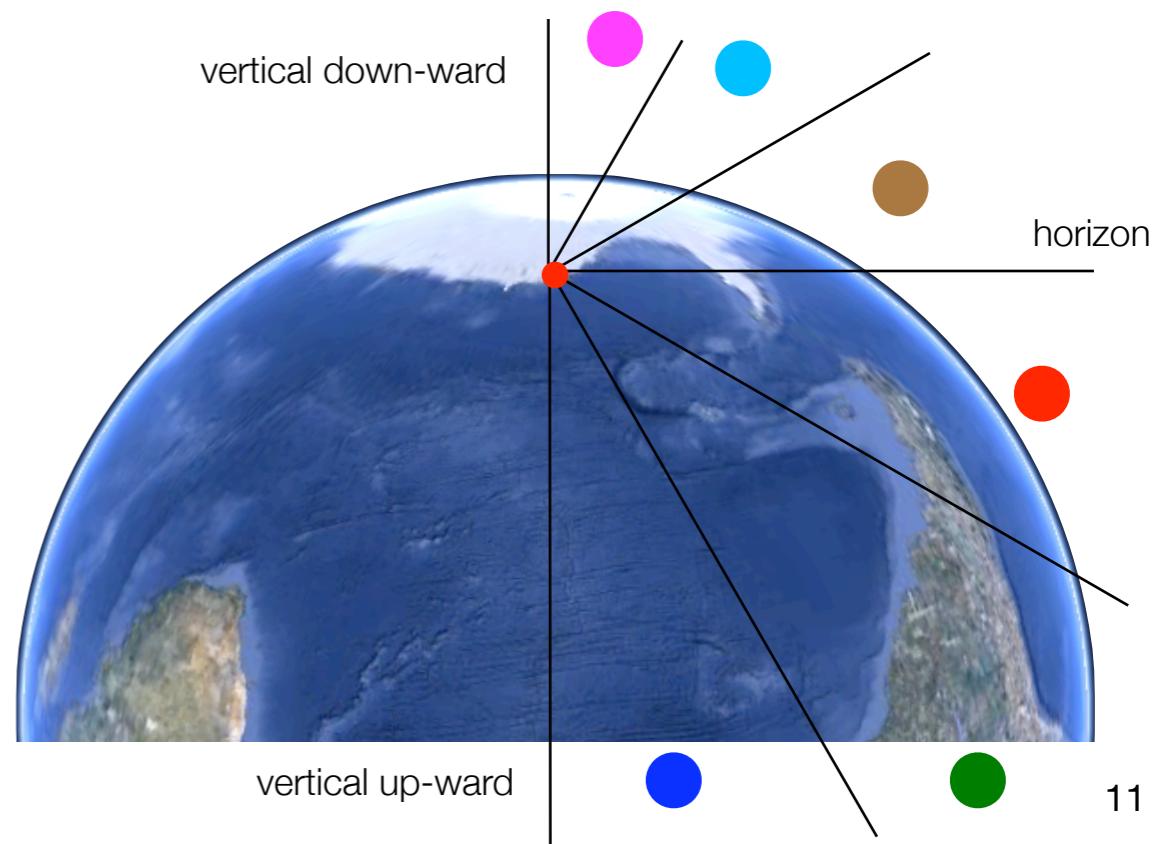

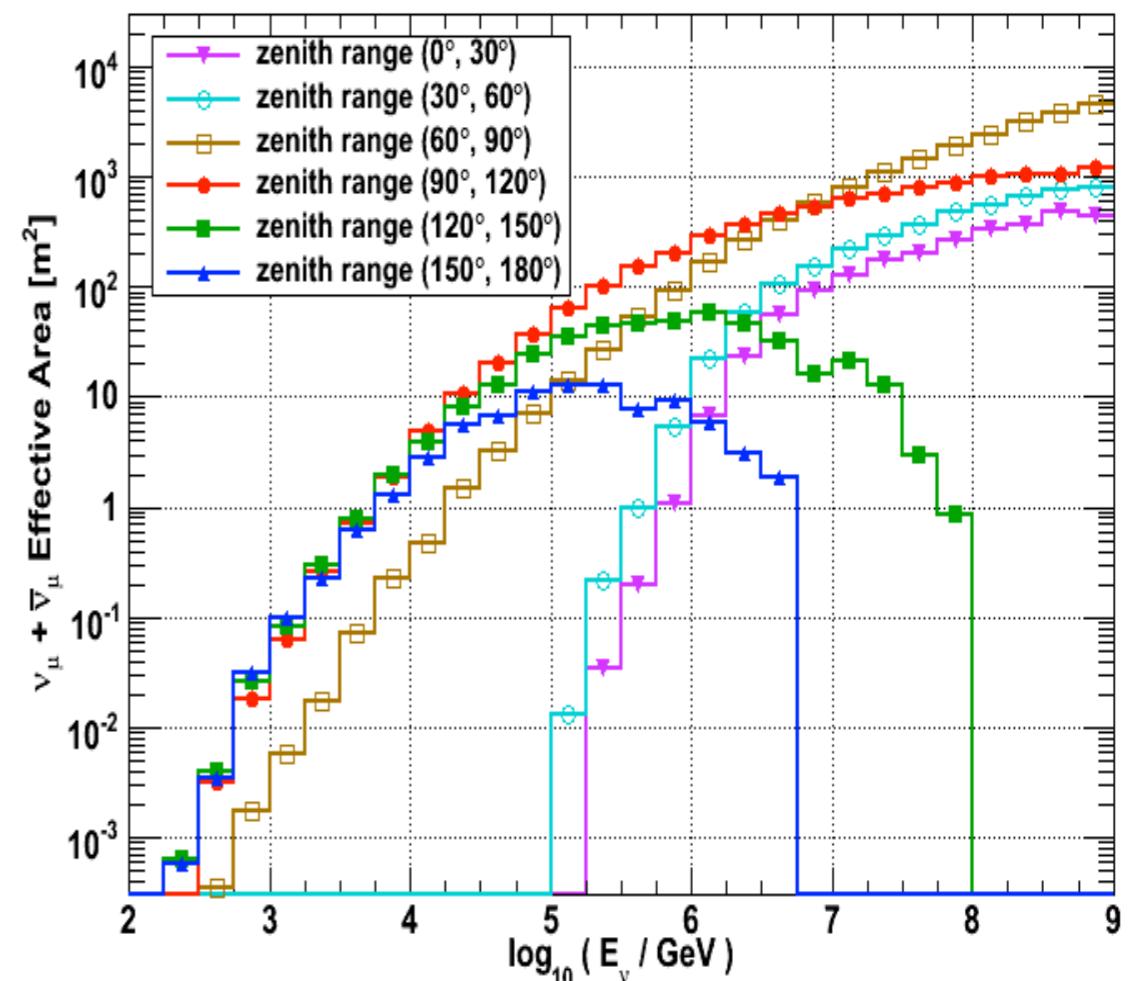

neutrino and gamma connection

steady point sources

angular resolution

neutrino effective area for IceCube 40

$$n_p(\nu) = T_{\text{live}} \cdot \int_{\Omega} \int_{E_\nu^{\min}}^{E_\nu^{\max}} A_{\text{eff}}^\nu(E_\nu, \delta) \frac{d\Phi_\nu}{d\Omega dE_\nu} d\Omega dE_\nu$$

steady point sources

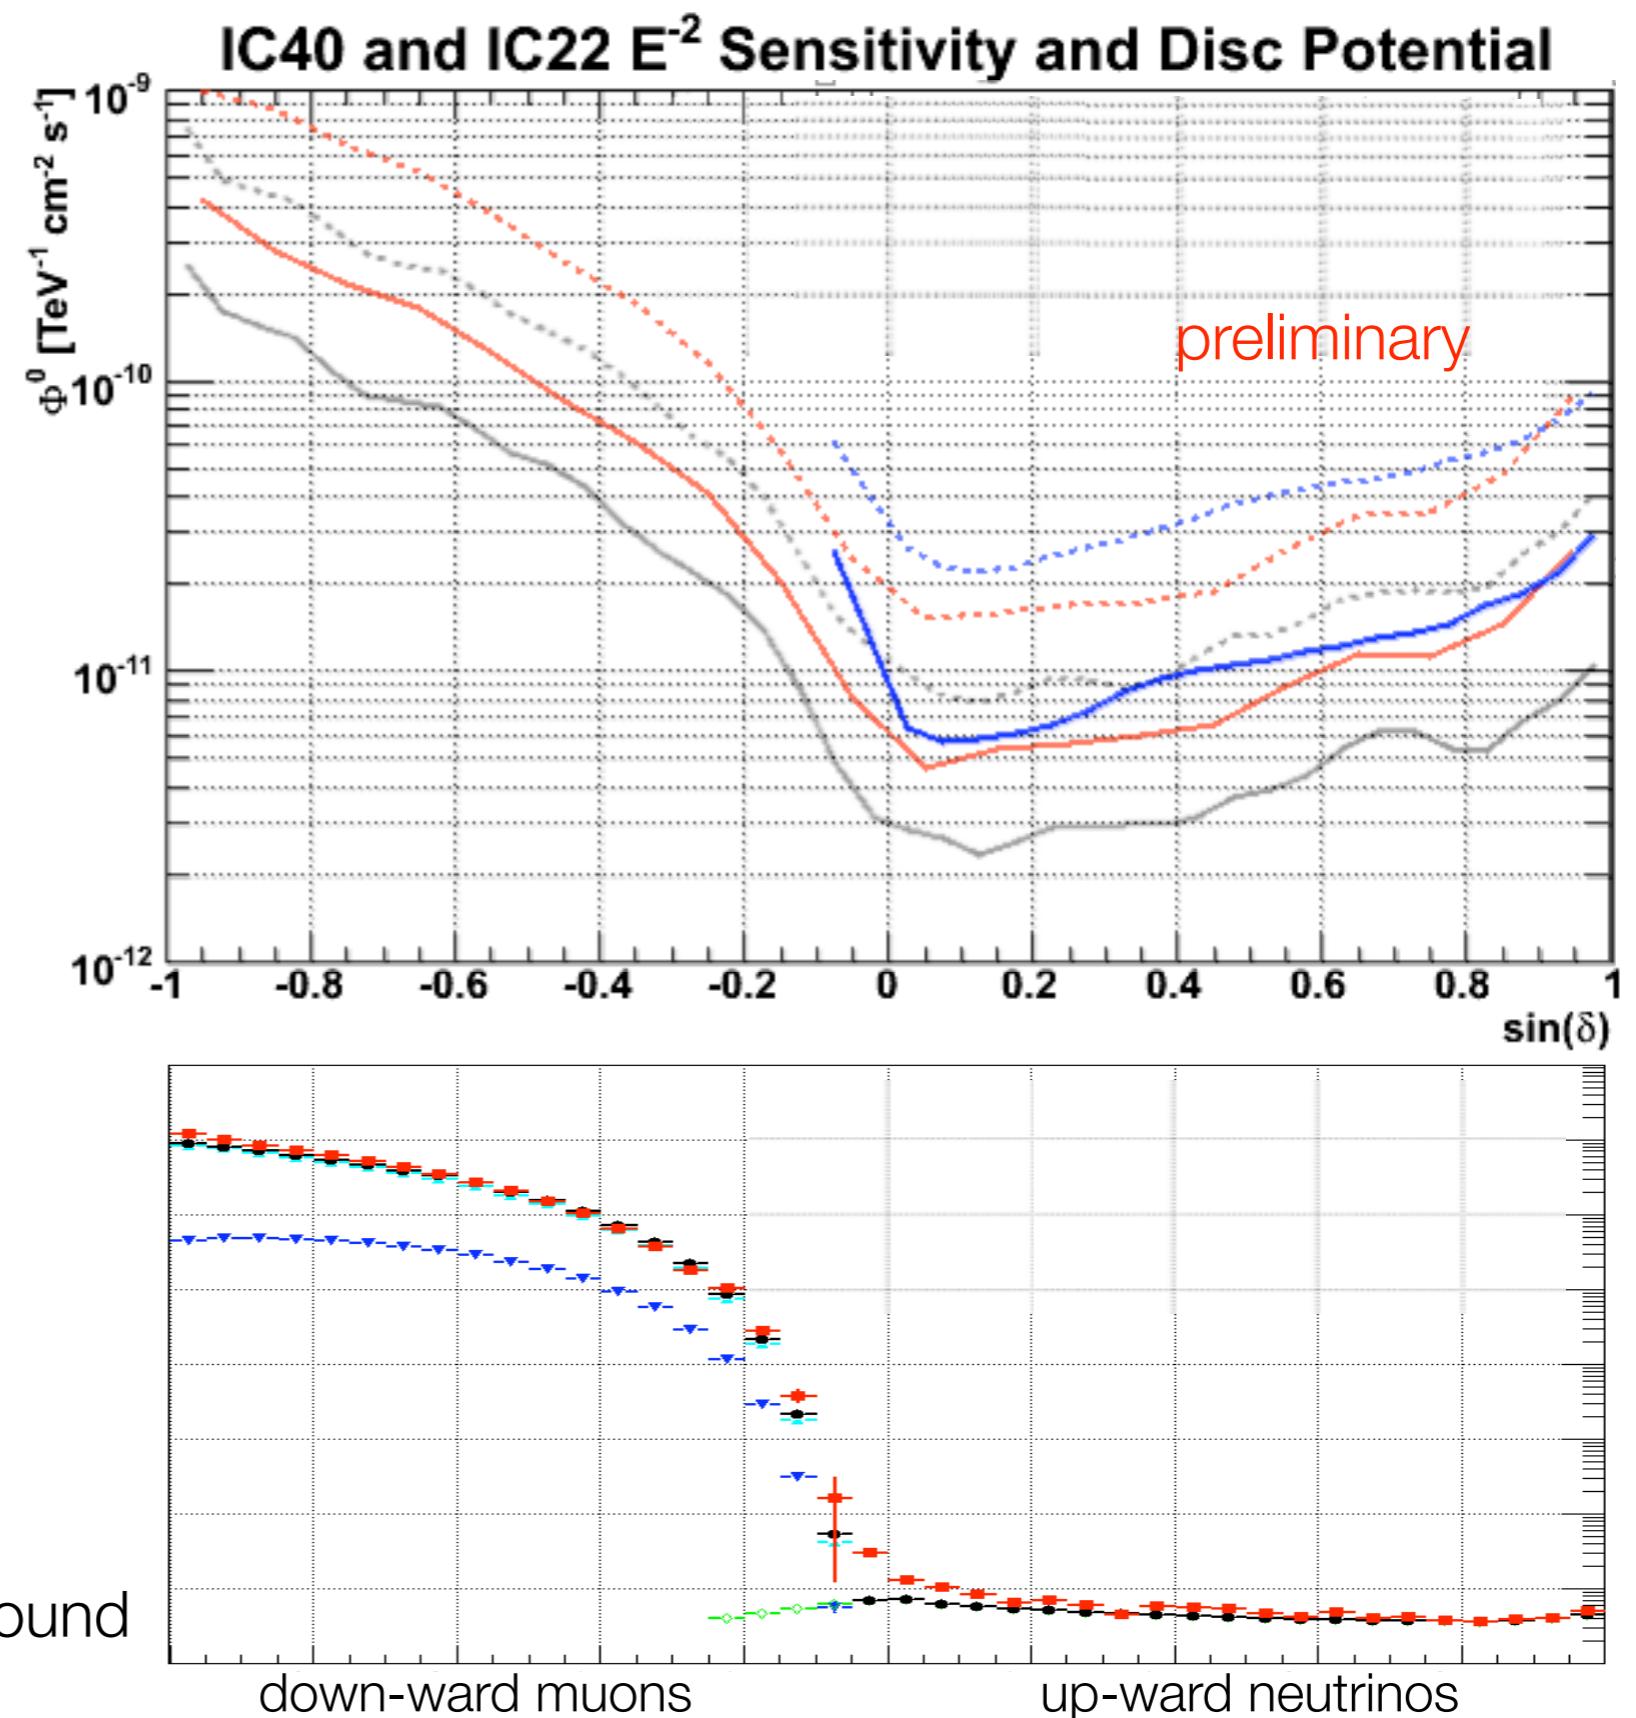

J Dumm, C Finley, T Montaruli

IC22 (275.7 d) : sensitivity
discovery potential

IC40 (175.5 d) : sensitivity
discovery potential

IC40 (275.6 d) : sensitivity
discovery potential

background

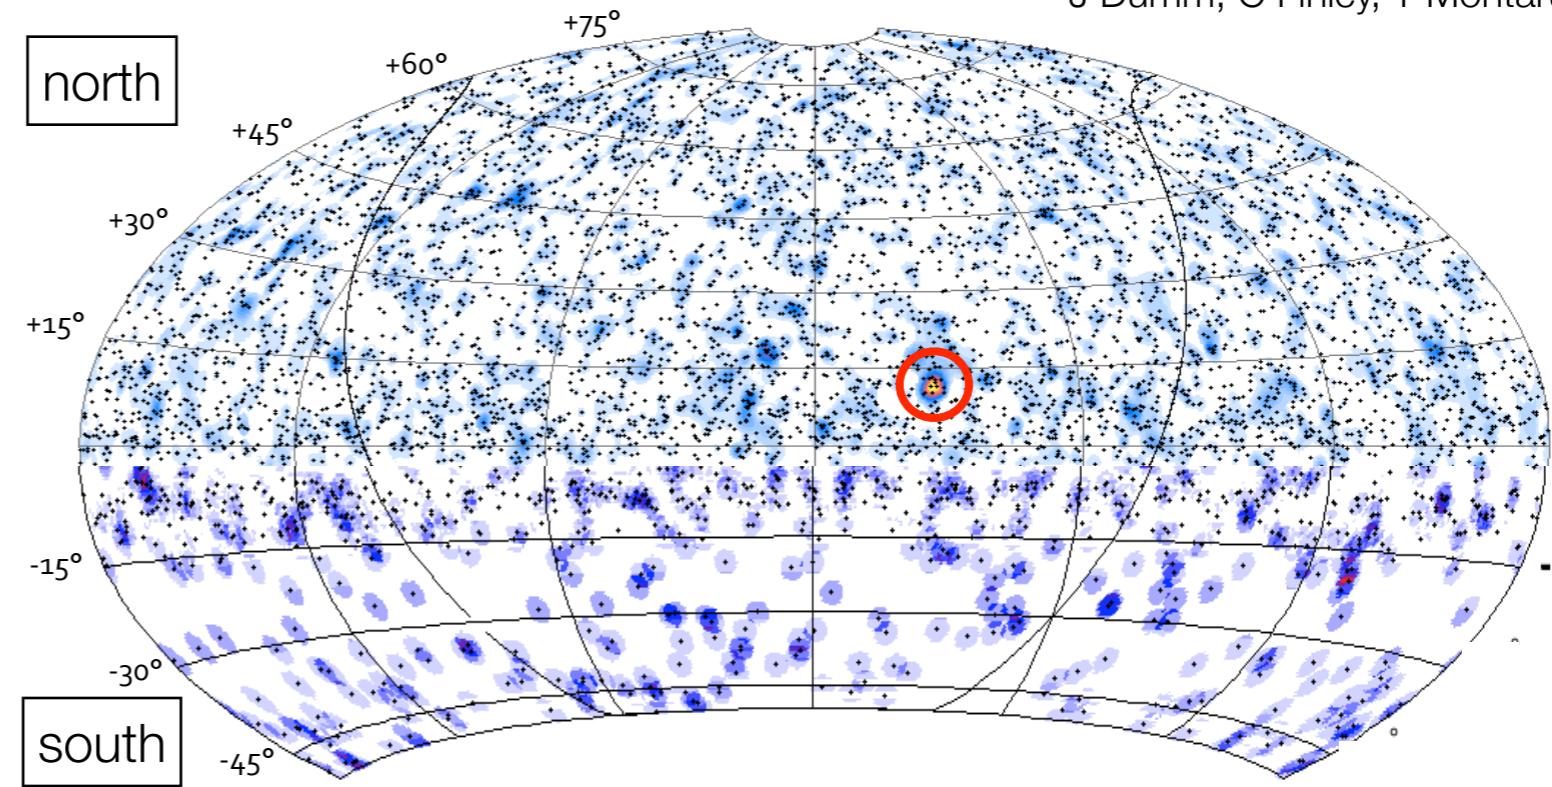

steady point sources

IceCube 22 strings (2007)

Abbasi et al., *Astrophys.J.*701:L47-L51 (2009), arXiv:0905.2253

J Dumm, C Finley, T Montaruli

R Lauer, E Bernardini

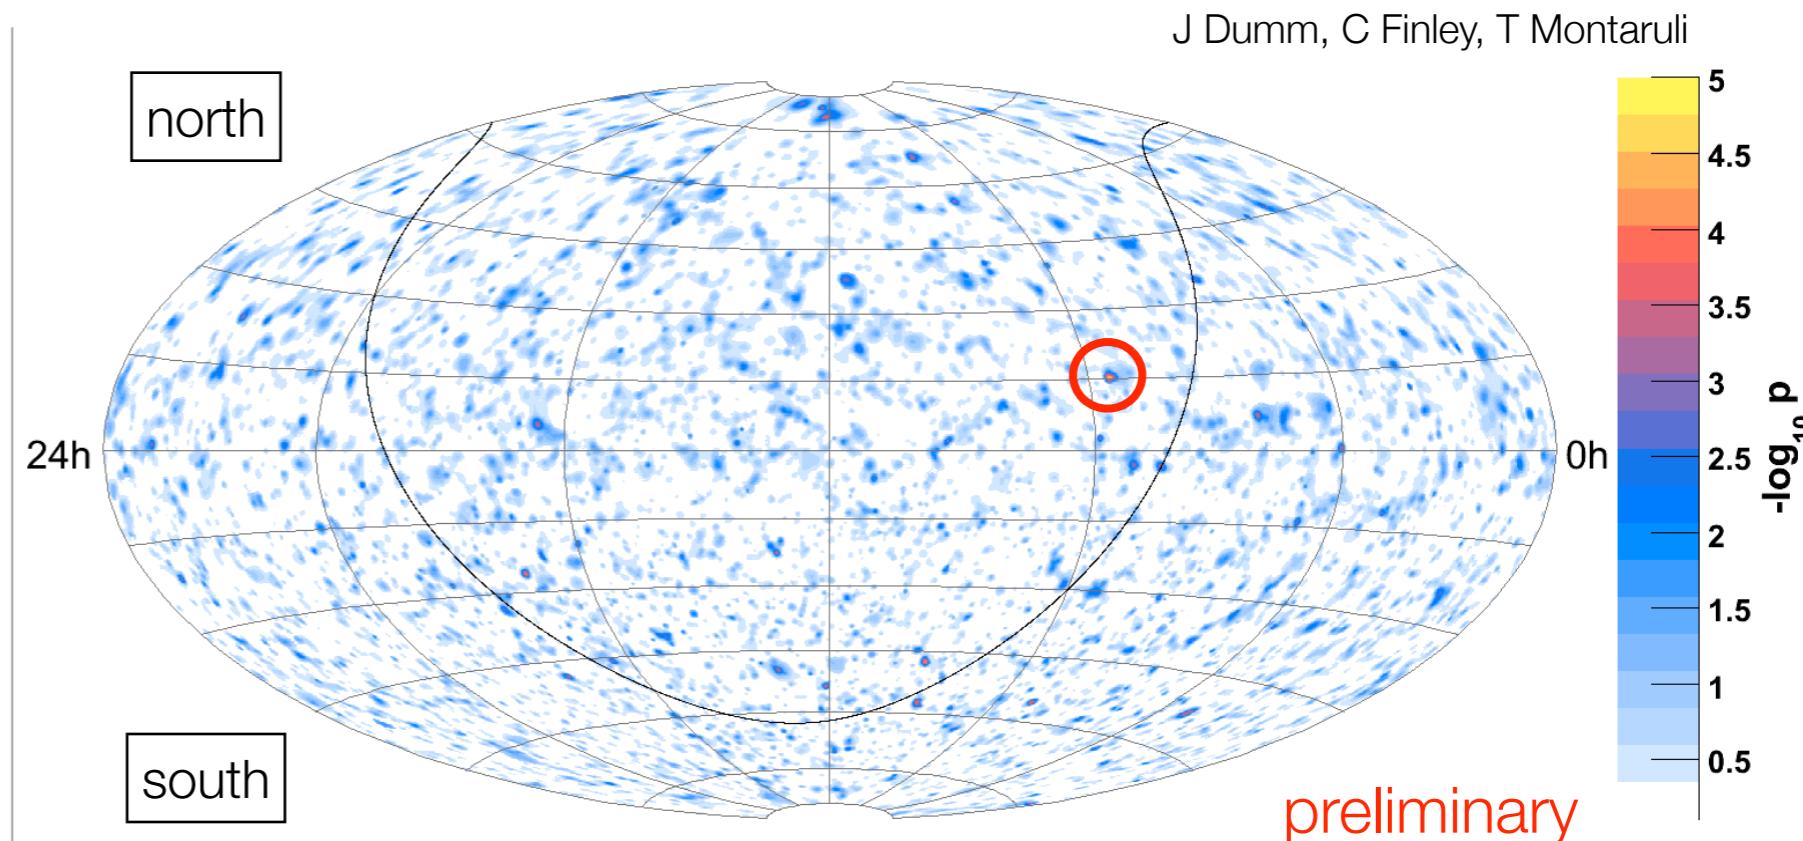

- hottest spot @ $\alpha = 153.4^\circ$
 $\delta = 11.04^\circ$
- post-trial $-\log_{10}(p\text{-value}) = 1.34\%$
= 2.2σ

Abbasi et al., *Phys.Rev.Lett.*103:221102 (2009), arXiv:0911.2338

- 275.7 days livetime
- northern hemisphere
 - ▶ up-going **atmospheric neutrino-induced** muons
- southern hemisphere
 - ▶ down-going **high energy** muons up to -50°

steady point sources

IceCube 40 strings (6 months of 2008)

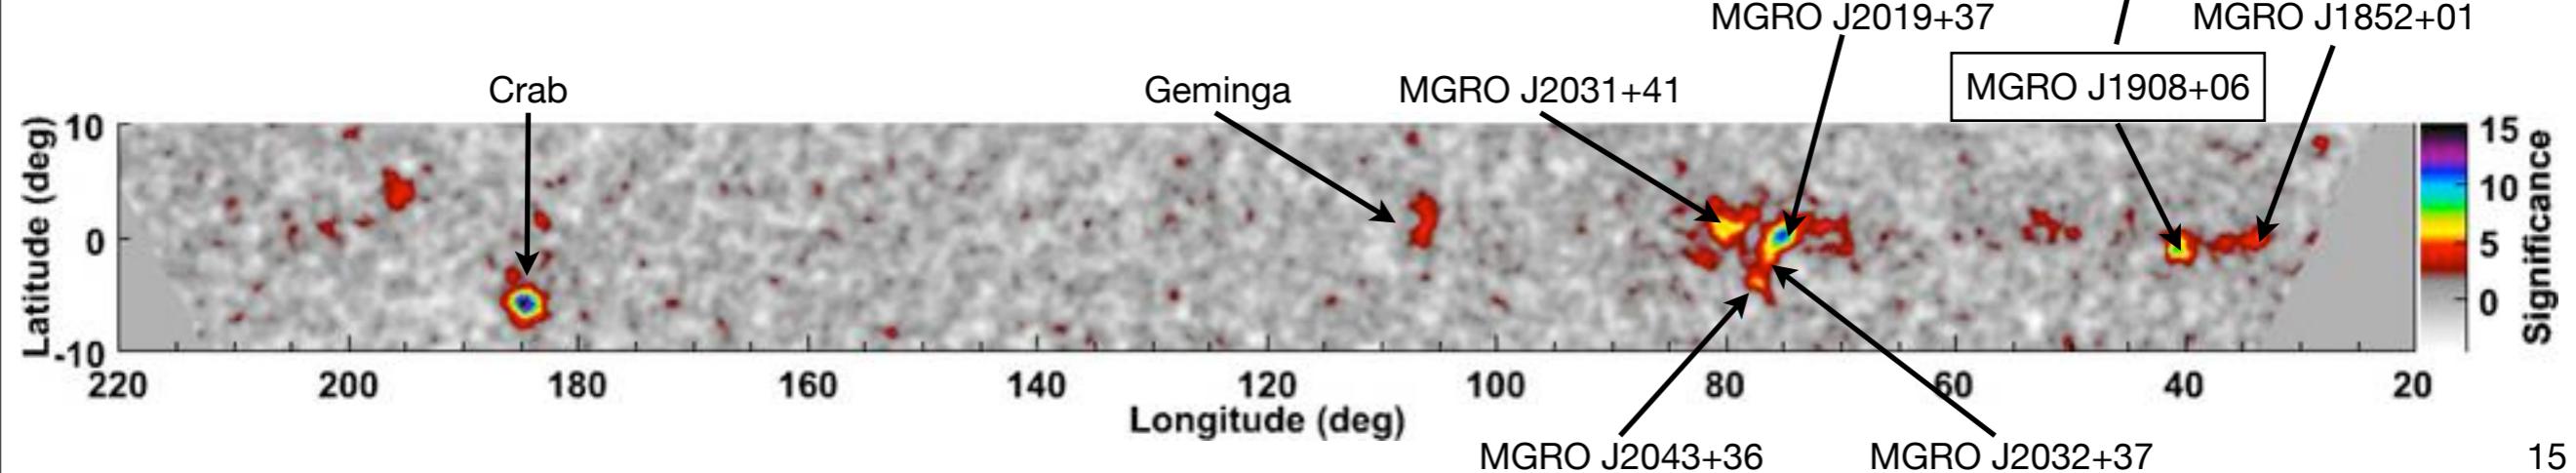

- hottest spot @ $\alpha = 114.95^\circ$
 $\delta = 15.35^\circ$
- pre-trial $-\log_{10}(p\text{-value}) = 4.43$
- best-fit # of source events = 7.1
- best-fit spectral index = 2.1
- all-sky p-value = 61%

- 175.5 days livetime
- northern hemisphere
 - ▶ 6,796 up-going atmospheric neutrino-induced muons
- southern hemisphere
 - ▶ 10,981 down-going high energy muons
 - ▶ 10^{-5} background rejection through energy cut ($\gtrsim 100$ TeV)
 - ▶ $\mu_\downarrow / \mu_\uparrow \sim 10^6$

It is believed that Galactic accelerators are powered by the conversion of 10^{50} erg of energy into particle acceleration by diffusive shocks associated with young (1000–10,000 year old) supernova remnants expanding into the interstellar medium [1].

searching for point sources

- search for extended sources ?
 - ▶ CR interacting in molecular clouds
 - ▶ CR from galactic plane
- 1 yr of IC86 to improve $> 2x$
- ▶ multi-wavelength
- ▶ time variabilities

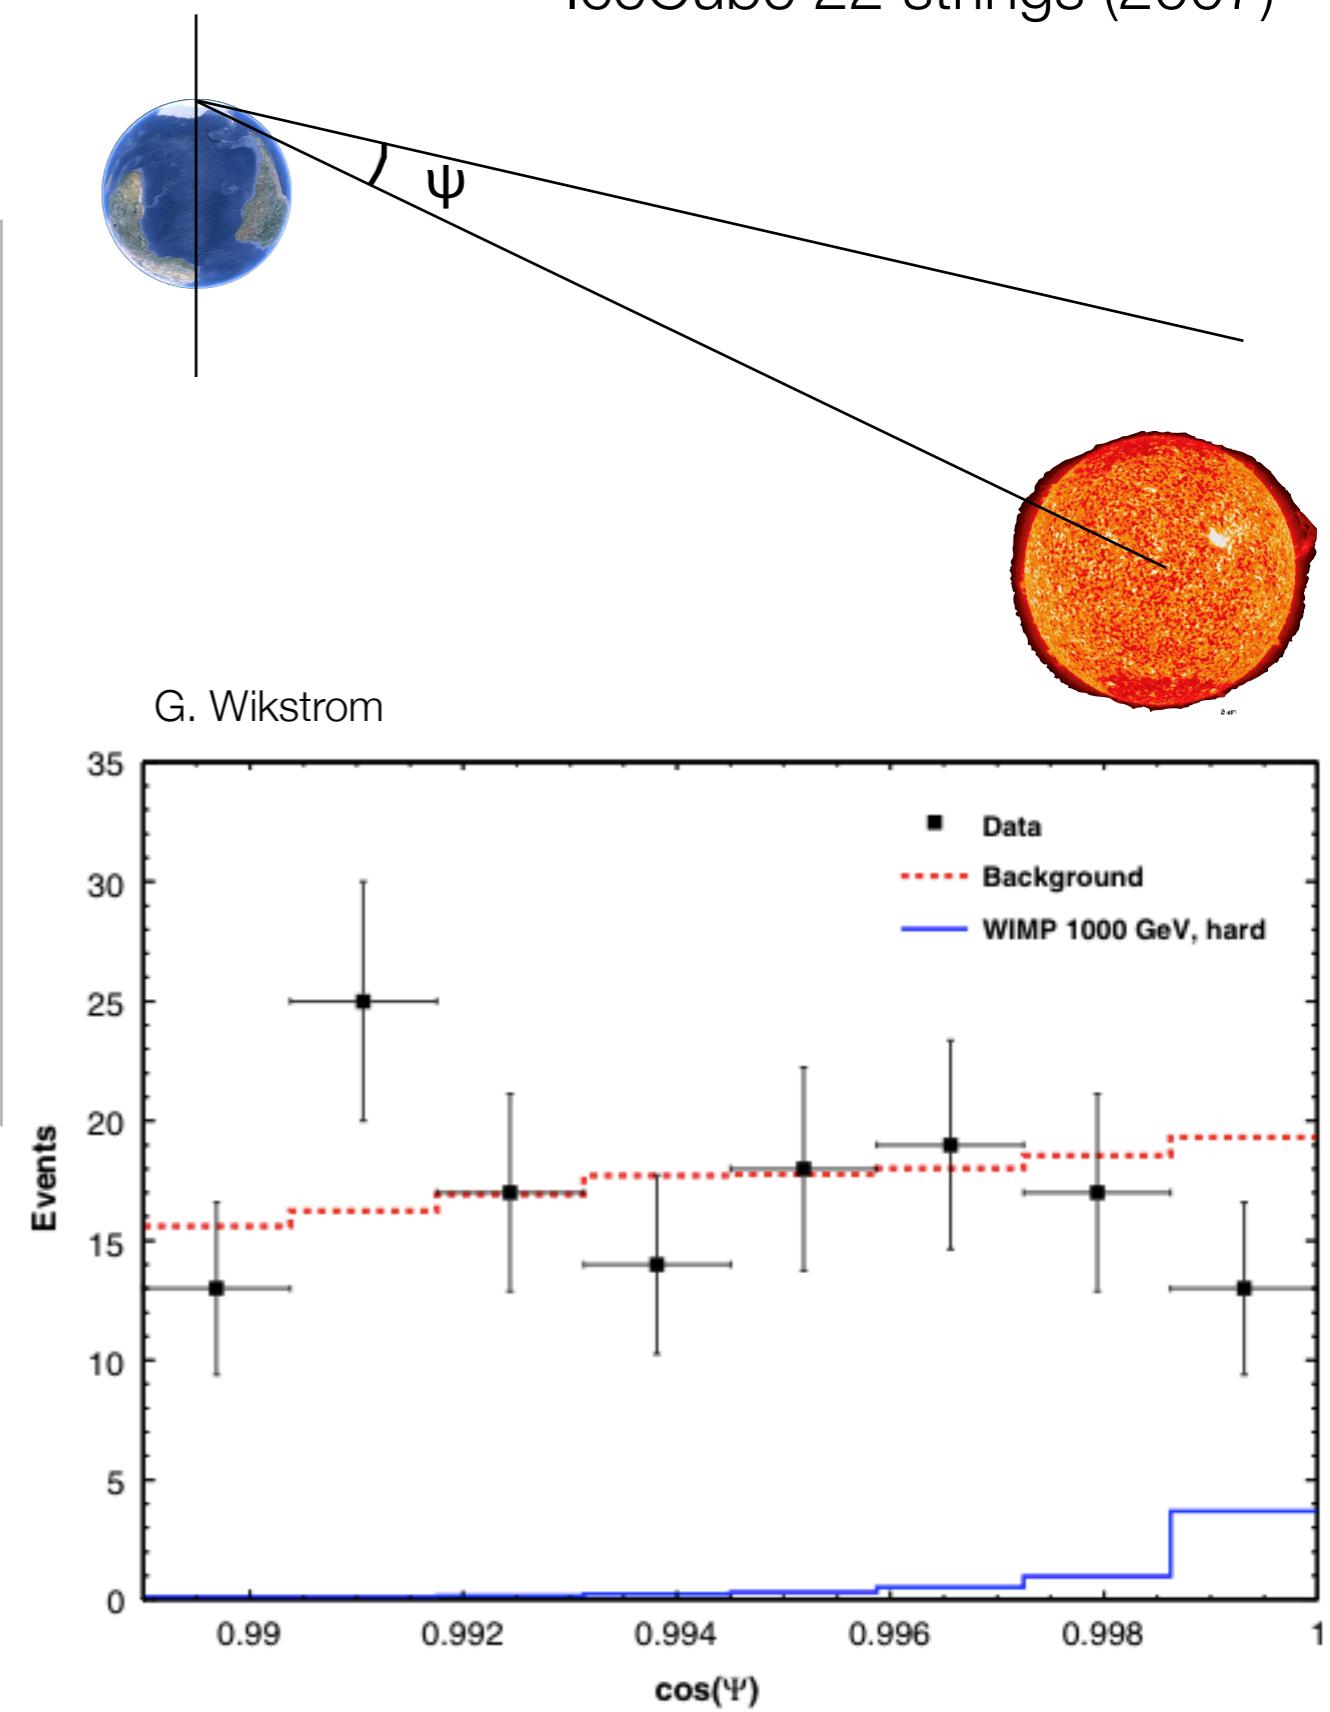

A. Kappes, F. Halzen, A.O'Murchadha, NIM A 602 (2009) 117

search for dark matter

- WIMP (x) annihilation in the Sun

IceCube 22 strings (2007)

search for dark matter

- WIMP (χ) annihilation in the Sun

- muon flux

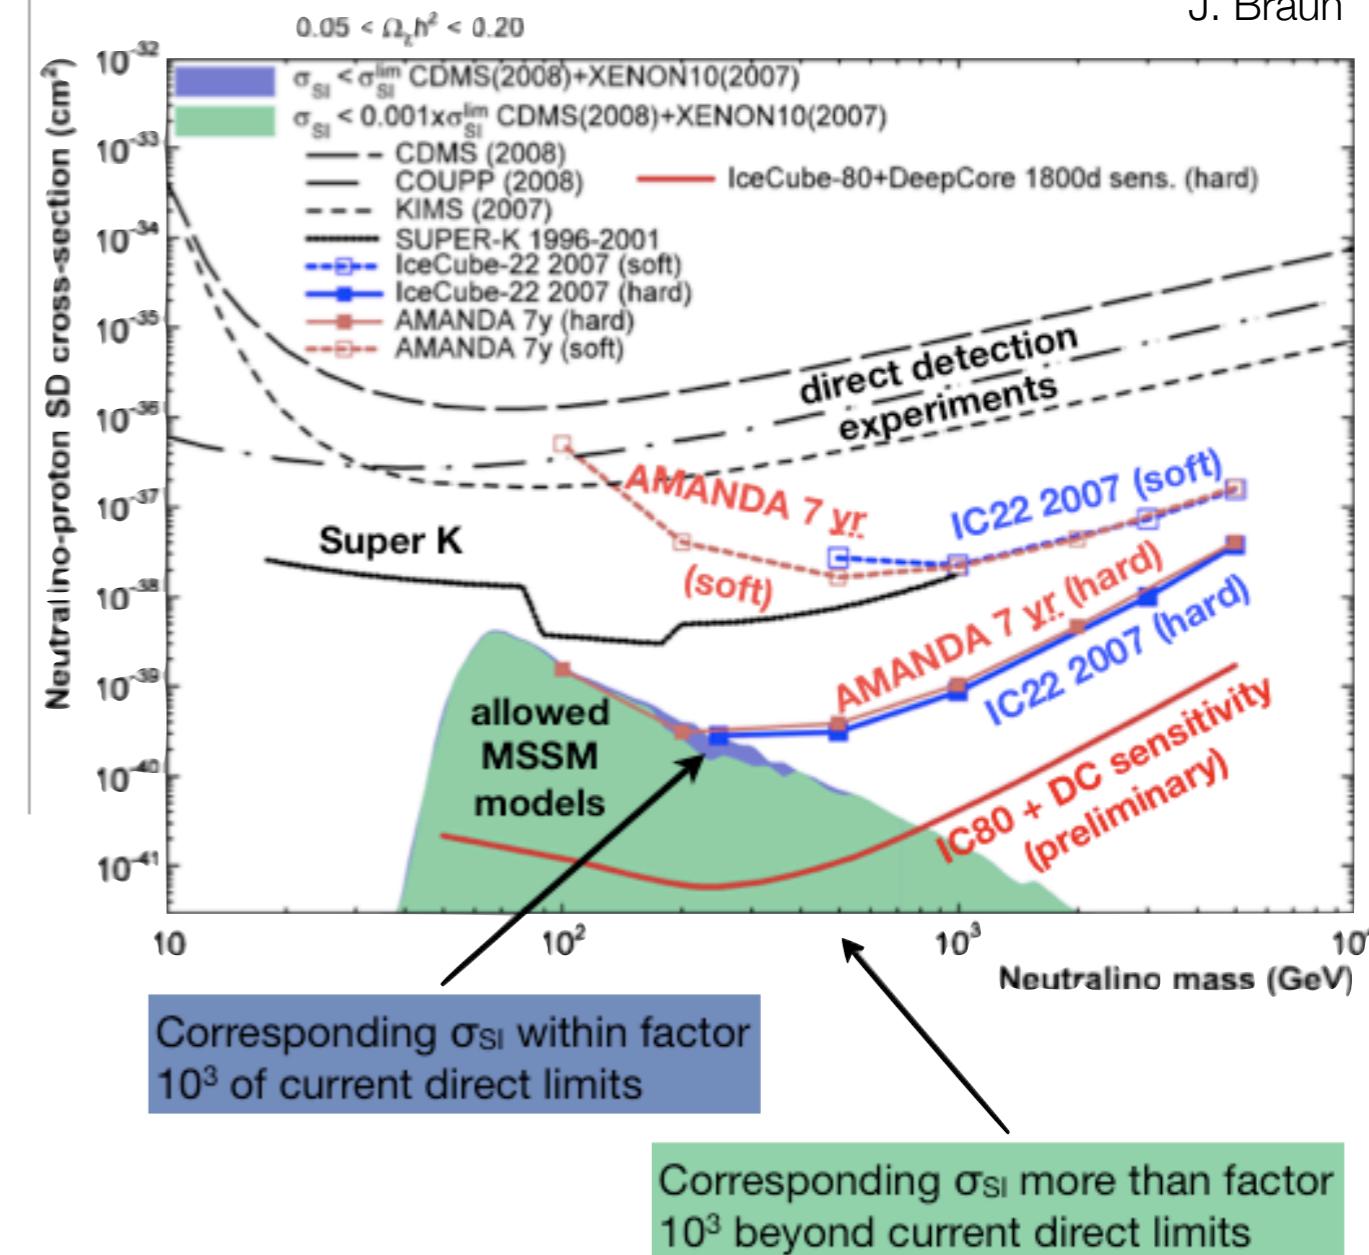

- spin dependent cross section

- σ_{SI} well constraint by direct detection experiments

- require models of solar DM distribution & annihilation modes : W^+W^- (hard), bb (soft)

Abbasi et al., Phys.Rev.Lett.102:201302 (2009), arXiv:0902.2460

G. Wikstrom, M. Danninger, C. de los Heros
J. Braun

search for dark matter

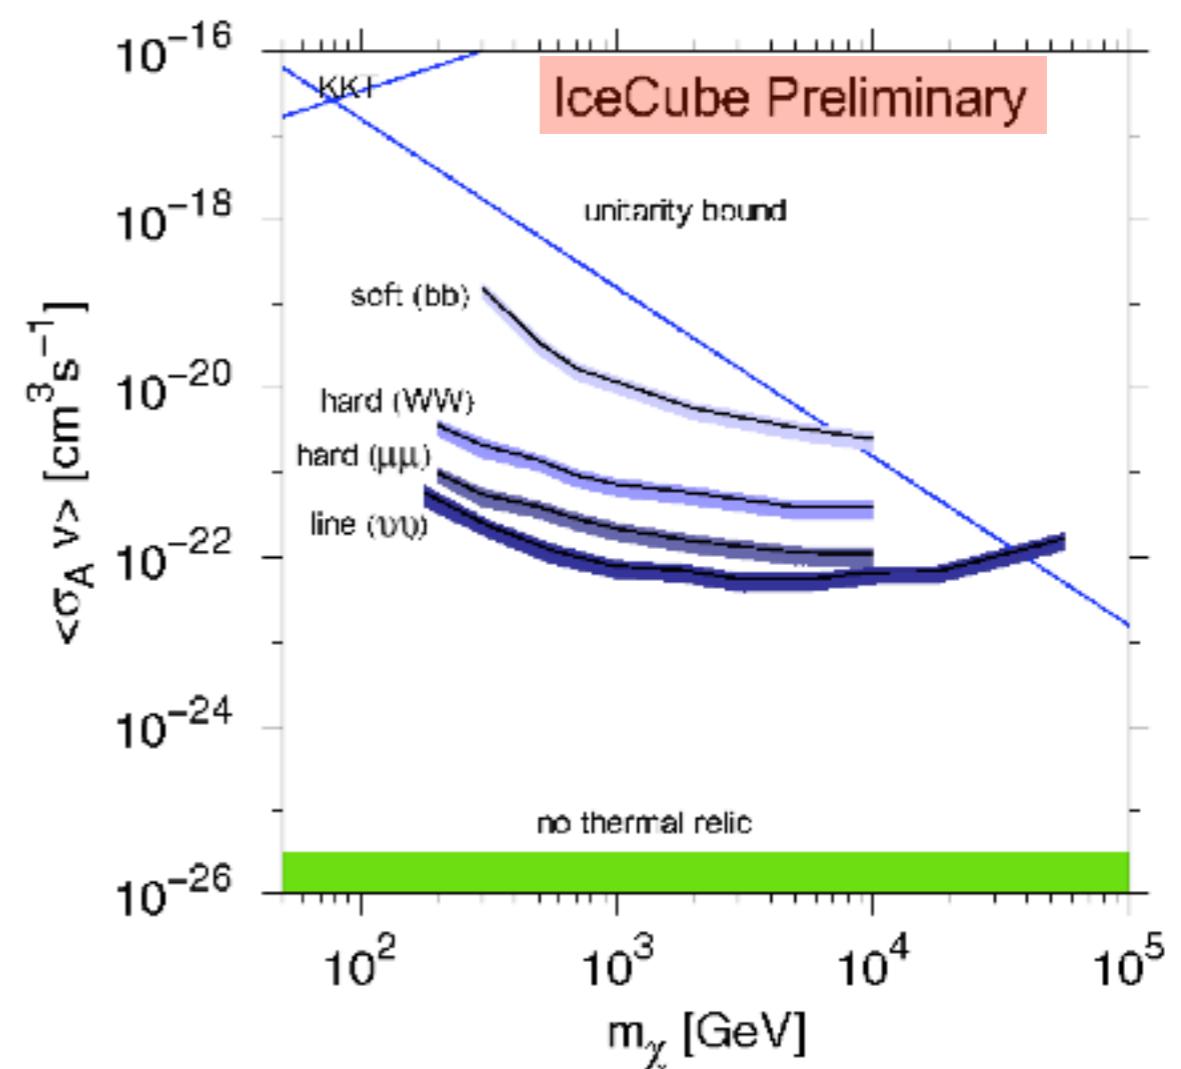

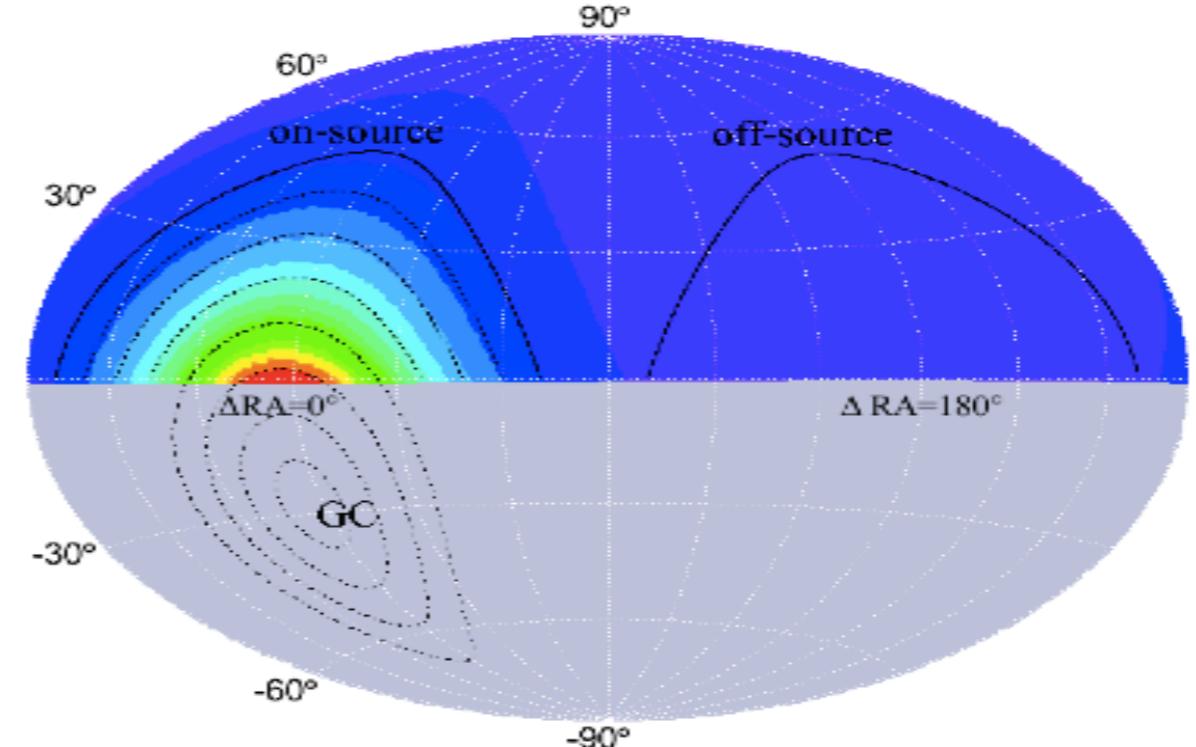

- WIMP from galactic halo

halo models

$$\frac{d\phi_\nu}{dE} = \frac{\langle \sigma_A v \rangle}{2} J(\psi) \frac{R_{sc} \rho_{sc}^2}{4\pi m_\chi^2} \frac{dN_\nu}{dE}$$

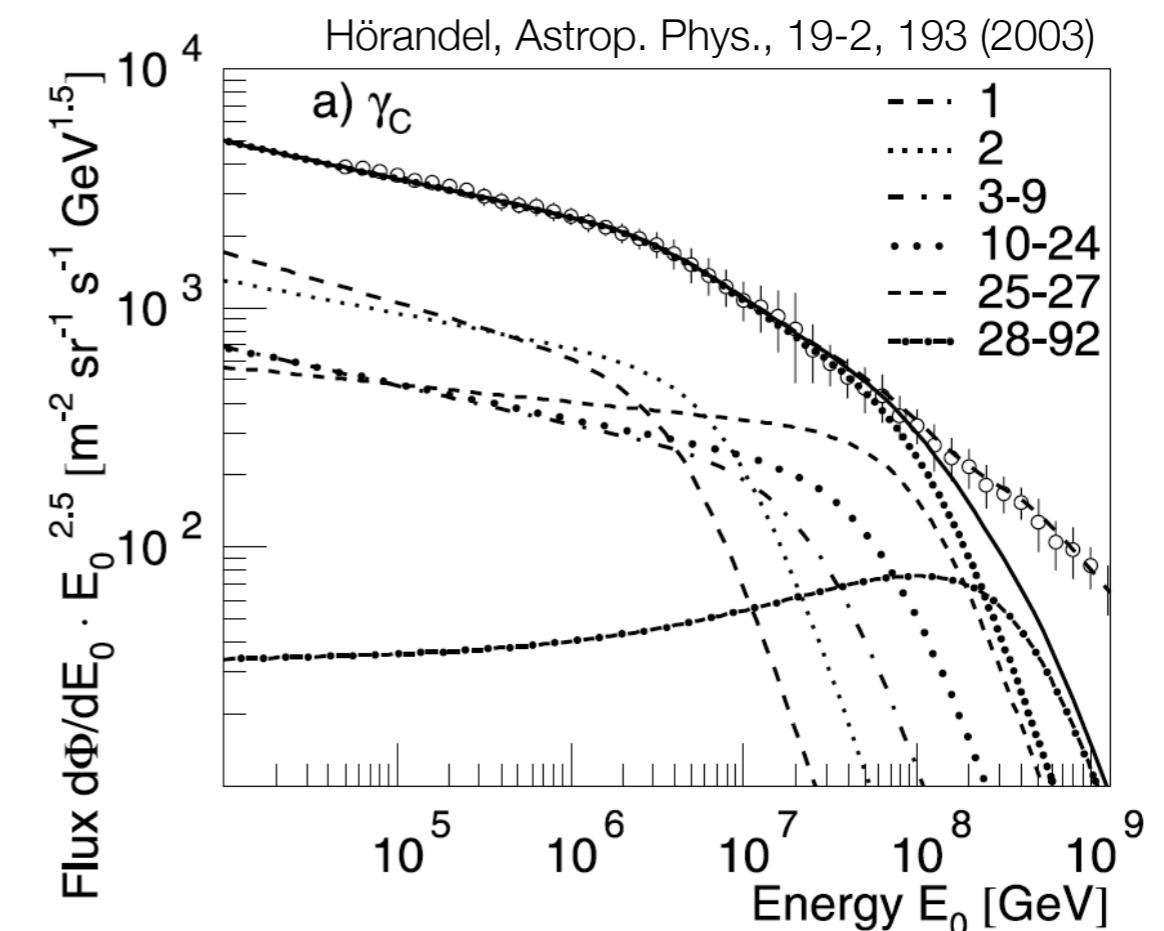

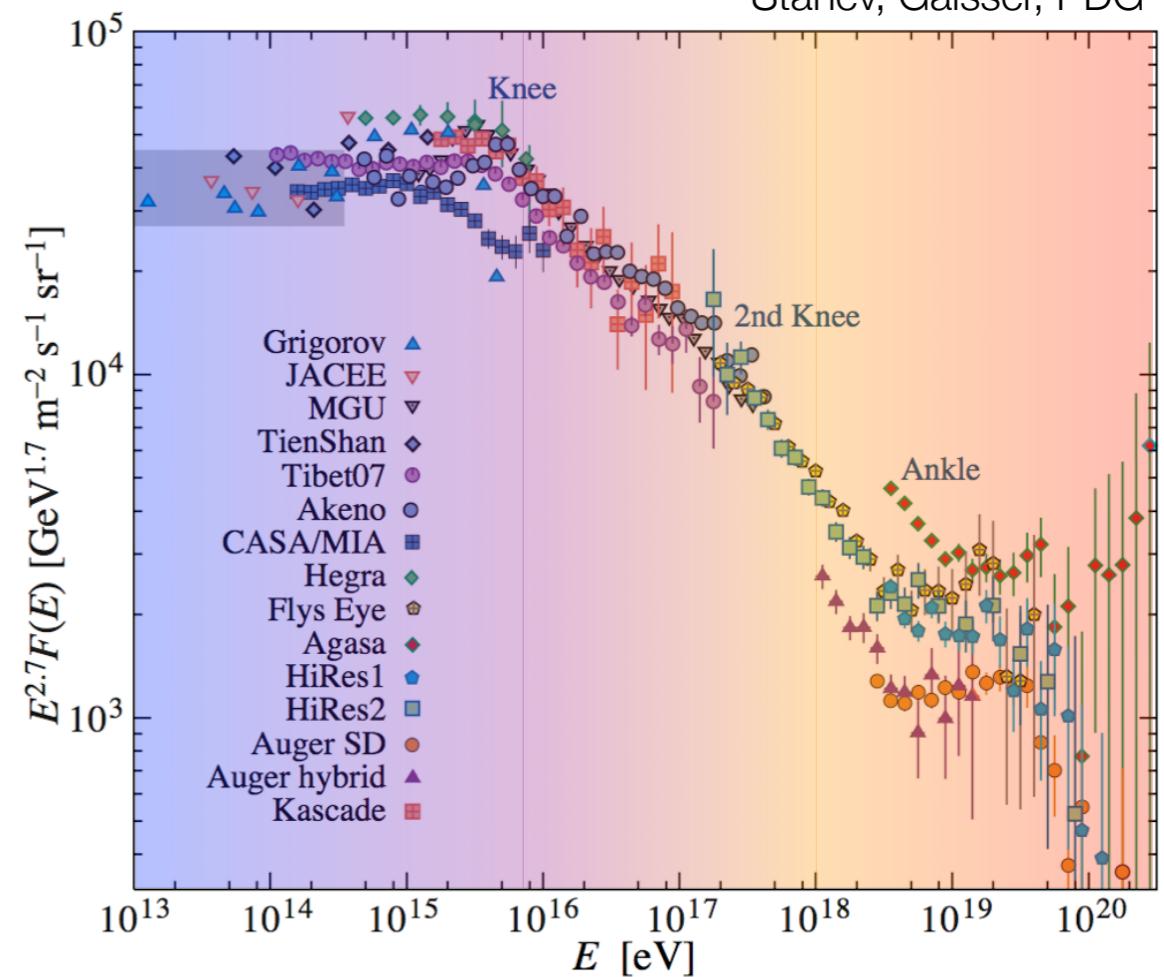

measurement constrain SUSY models

improvement expected with Deep Core (low energy extension) & with further event selection optimization (@ lower energy)

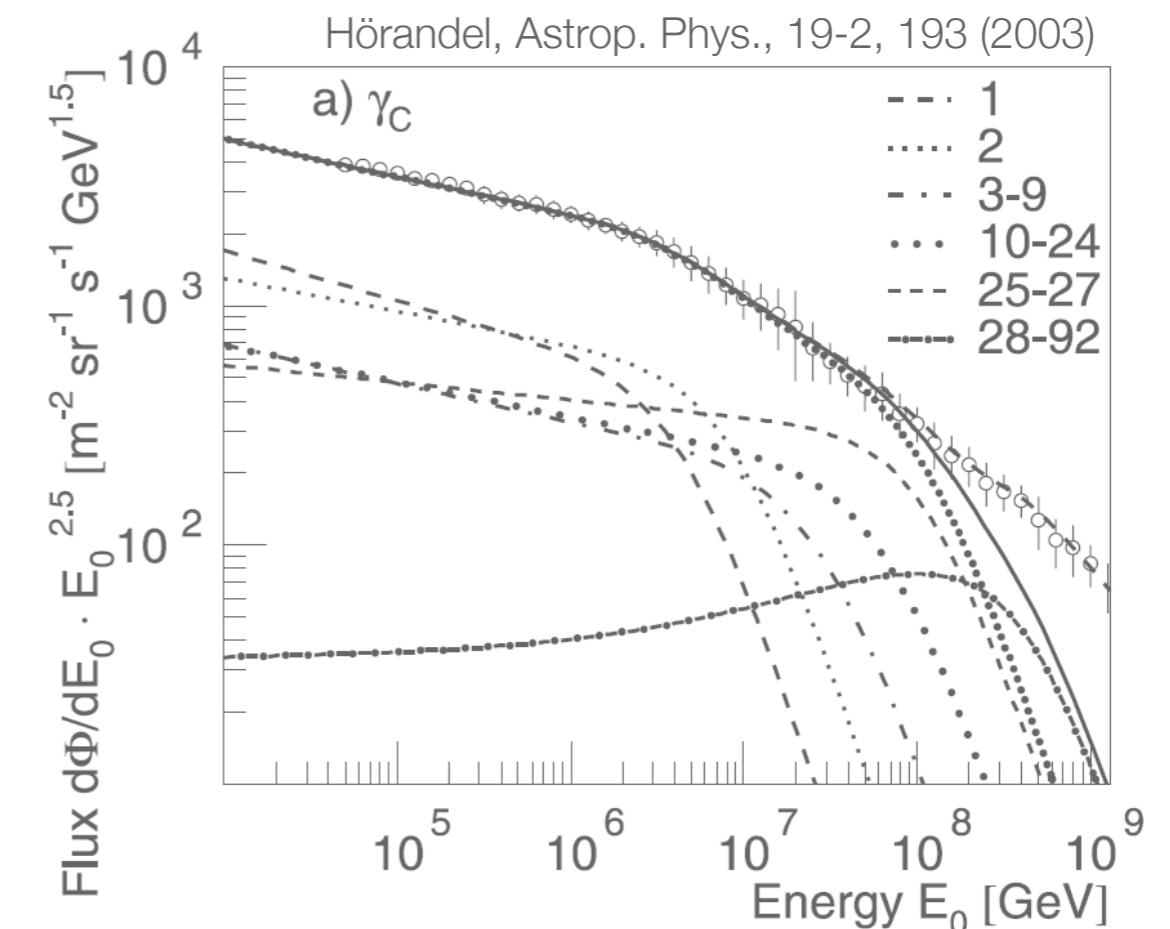

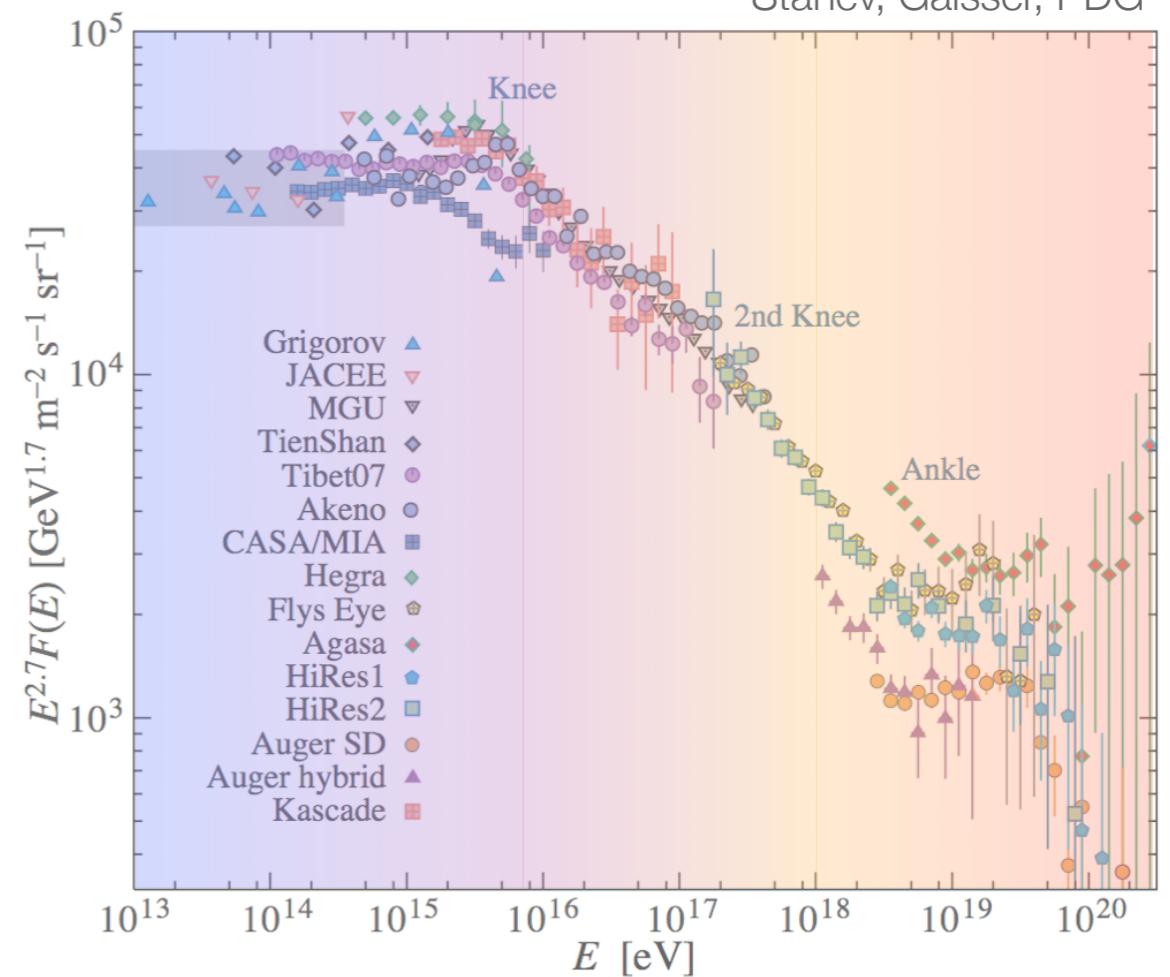

cosmic rays

- galactic CR believed to be accelerated in expanding shock waves initiated by supernova explosions
- SNe have enough power to sustain the CR population against escape from the Galaxy and energy losses, if there is a mechanism for channeling $\sim O(1)\%$ of the SN mechanical energy release into relativistic particles
- diffuse shock acceleration can accelerate CR up to $3 \cdot 10^{15} \cdot Z$ eV

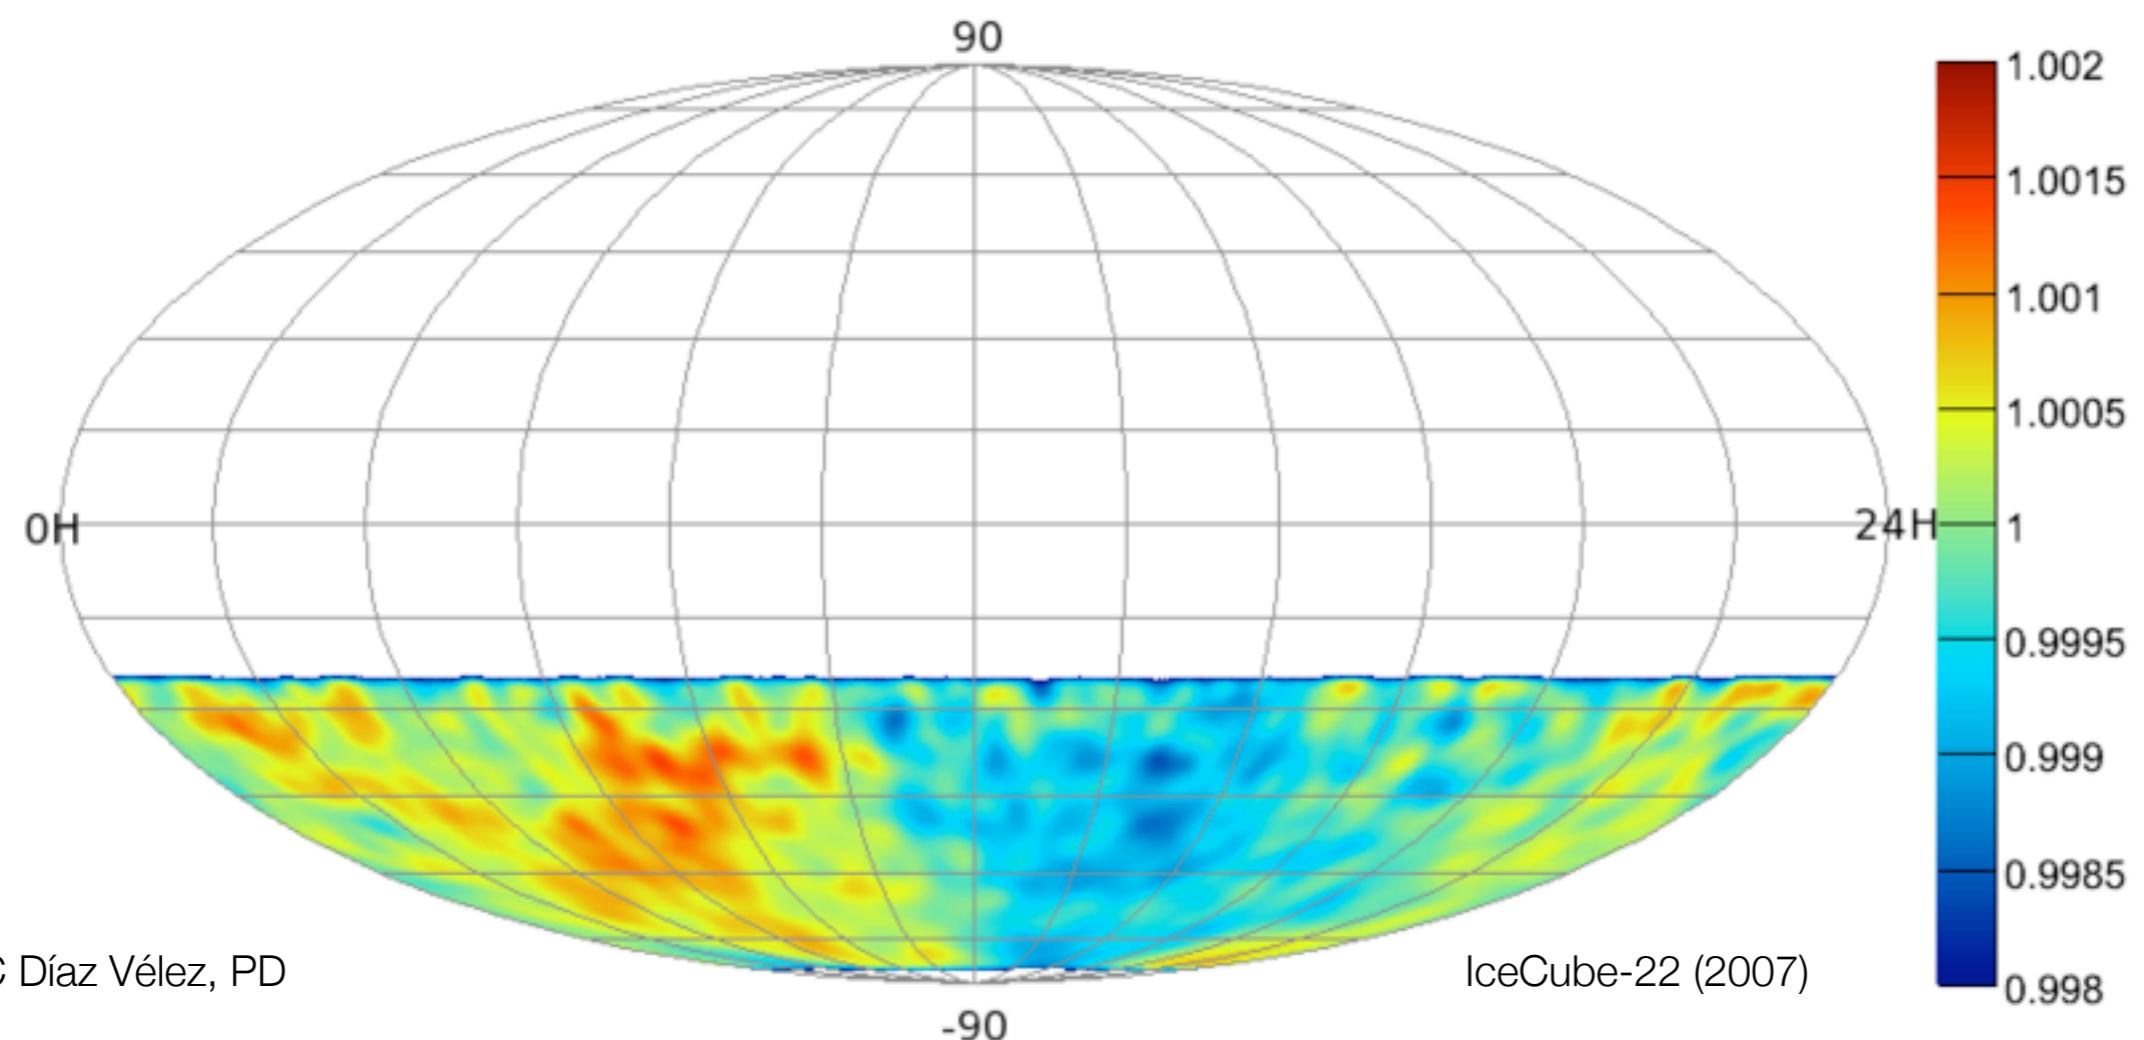

cosmic rays

- ▶ galactic CR believed to be accelerated in expanding shock waves initiated by supernova explosions
- ▶ SNe have enough power to sustain the CR population against escape from the Galaxy and energy losses, if there is a mechanism for channeling $\sim O(1)\%$ of the SN mechanical energy release into relativistic particles
- ▶ diffuse shock acceleration can accelerate CR up to $3 \cdot 10^{15} \cdot Z \text{ eV}$
- ▶ galactic CR expected to be isotropic : scrambled by galactic magnetic field over very long time

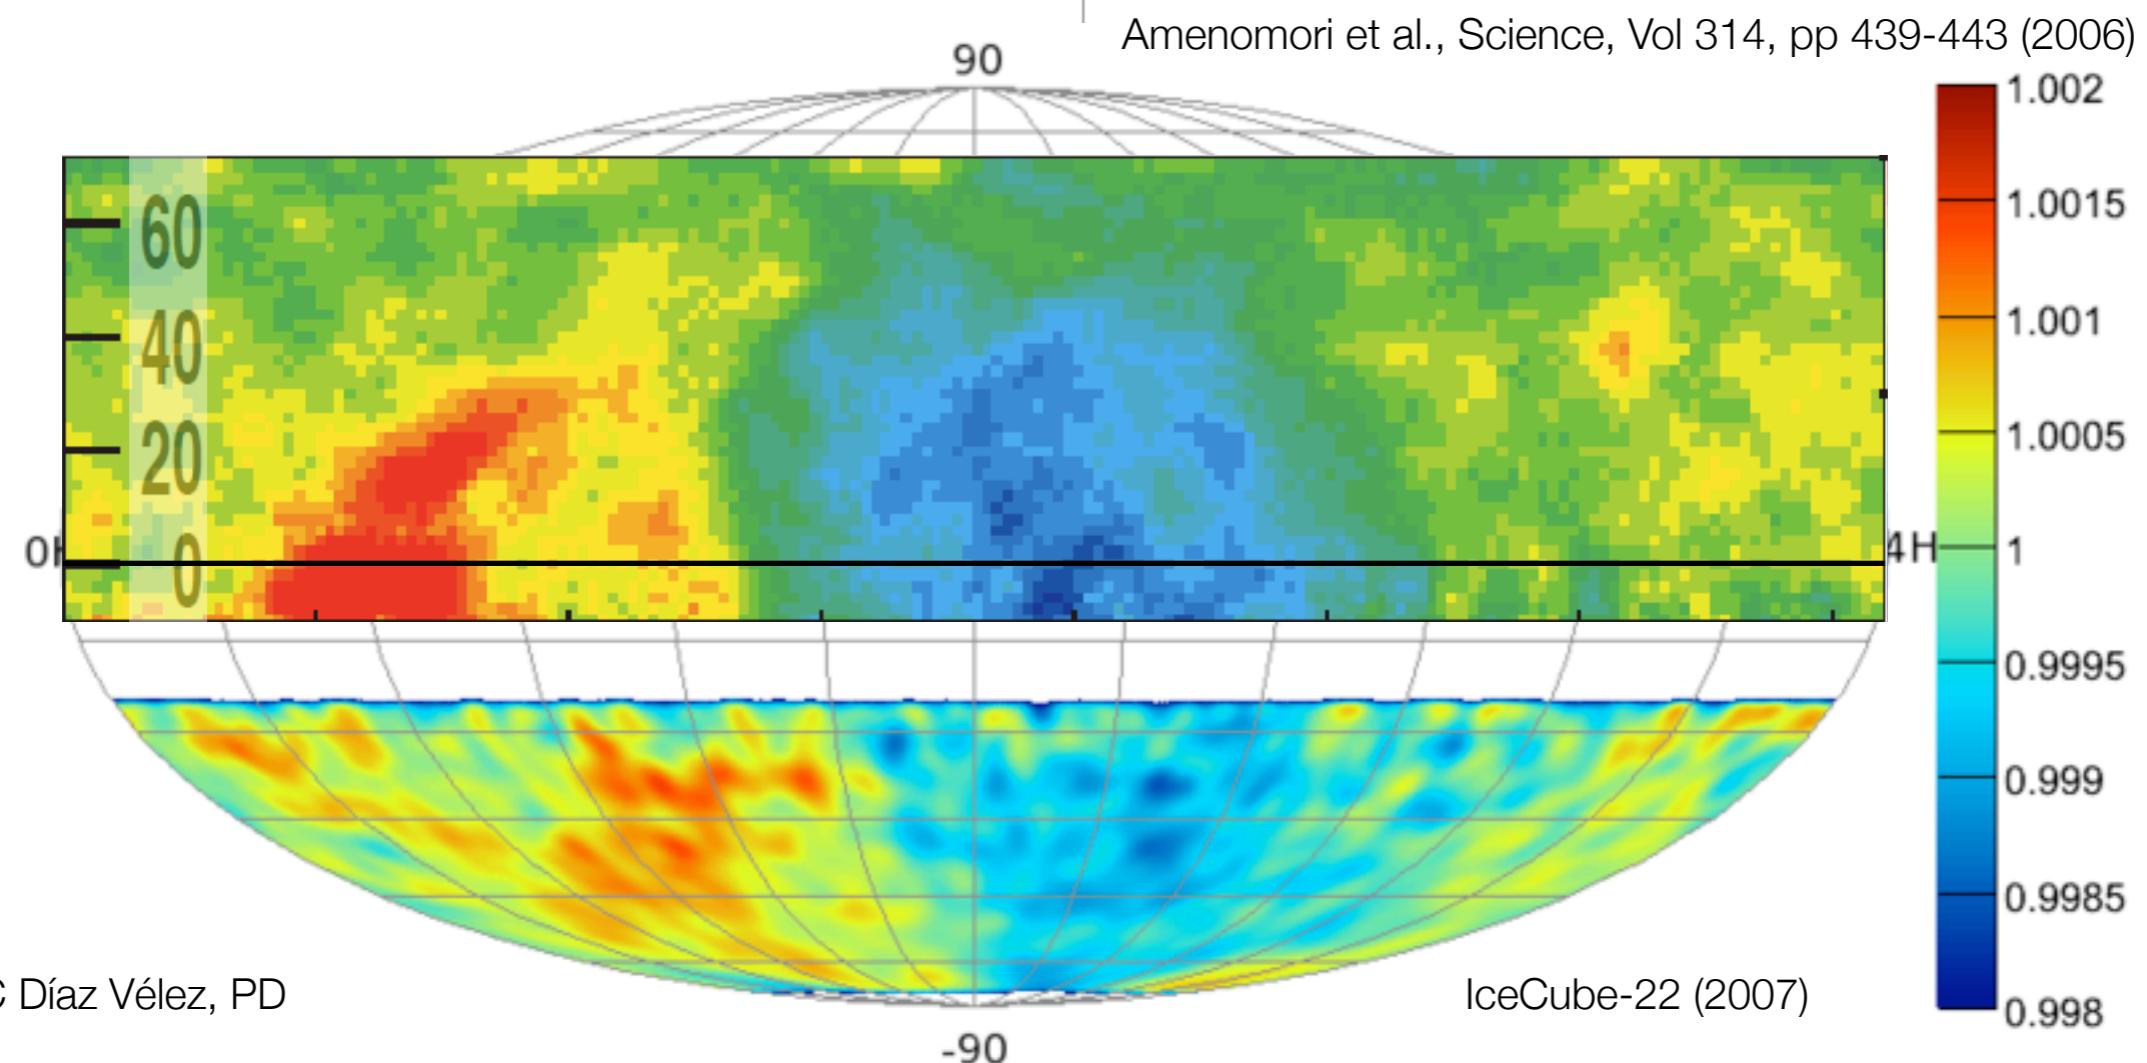

cosmic rays anisotropy

- ▶ measure relative CR variation in individual declination bands
- ▶ arrival direction anisotropy of $O(10^{-4})$

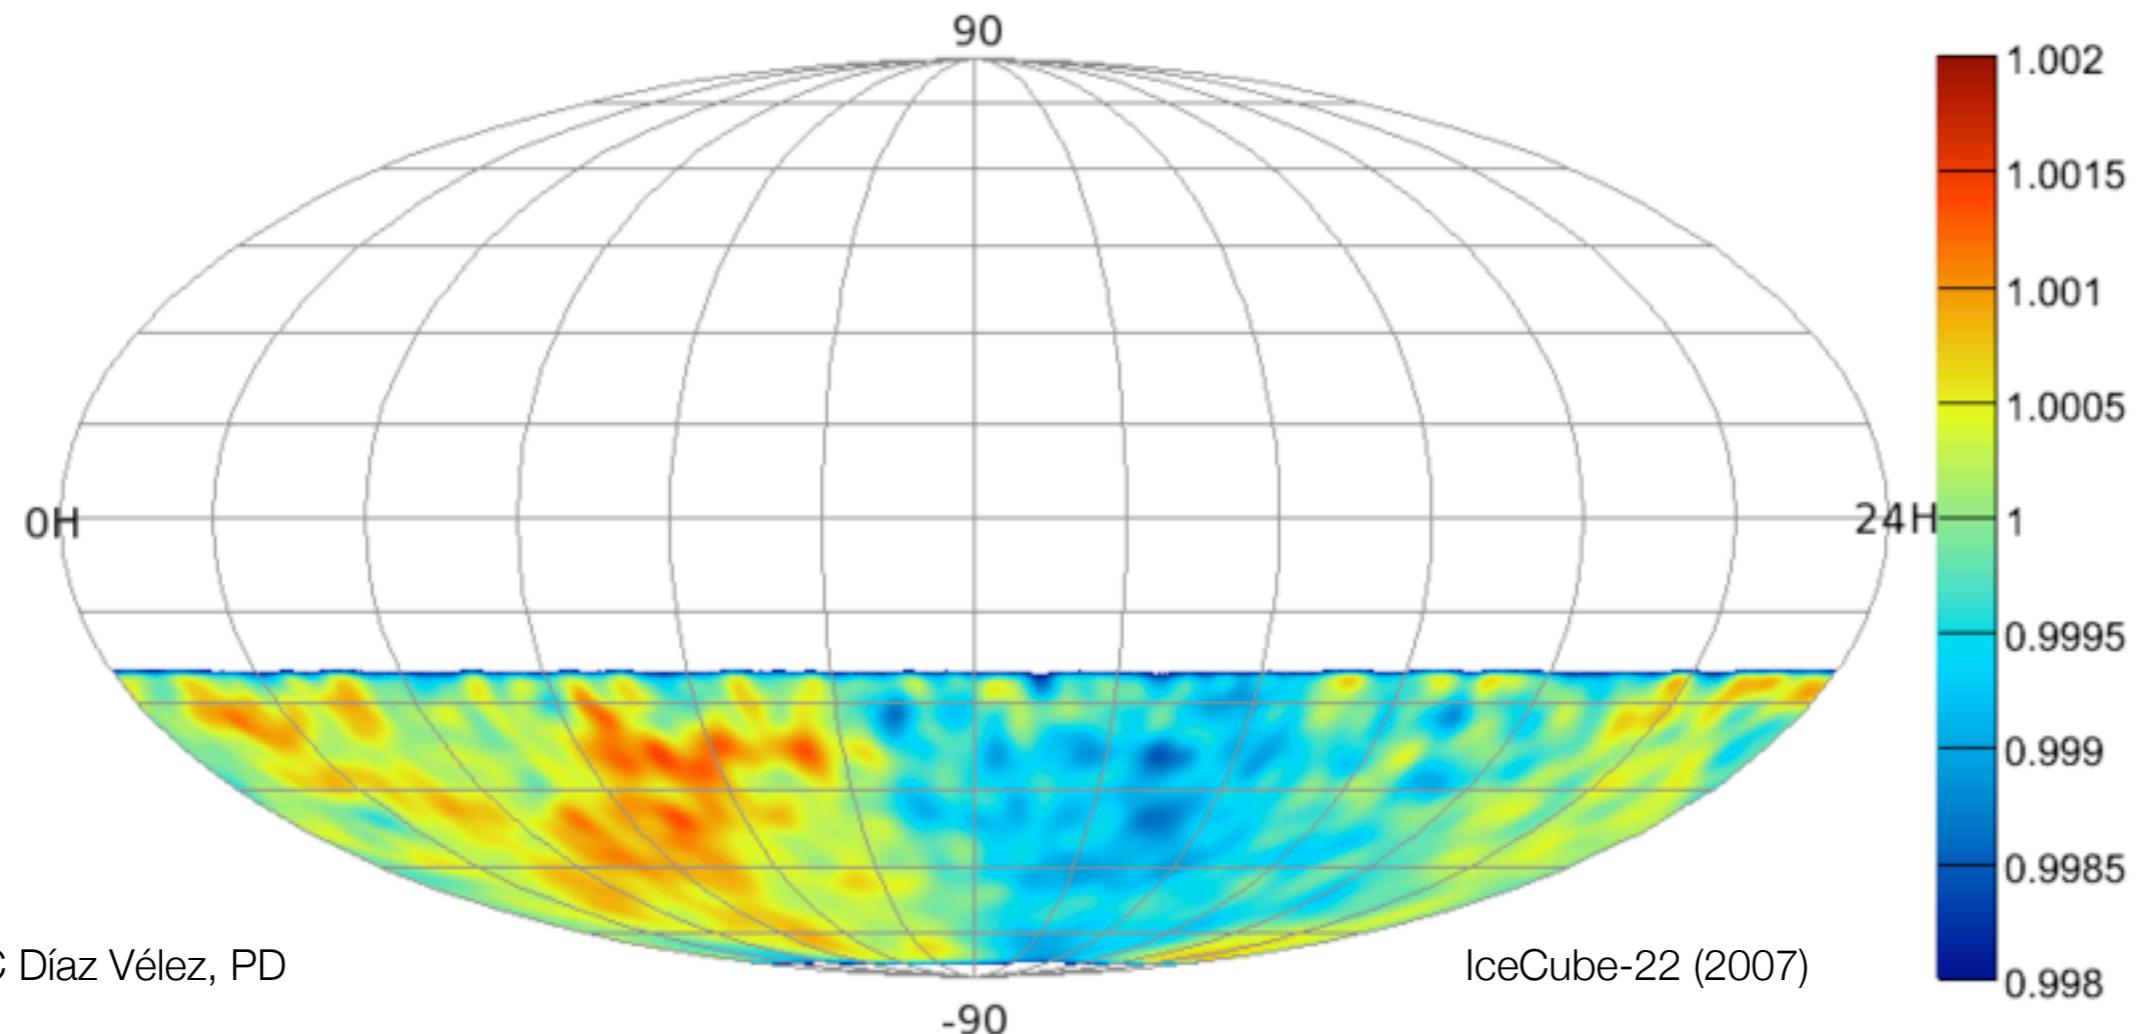

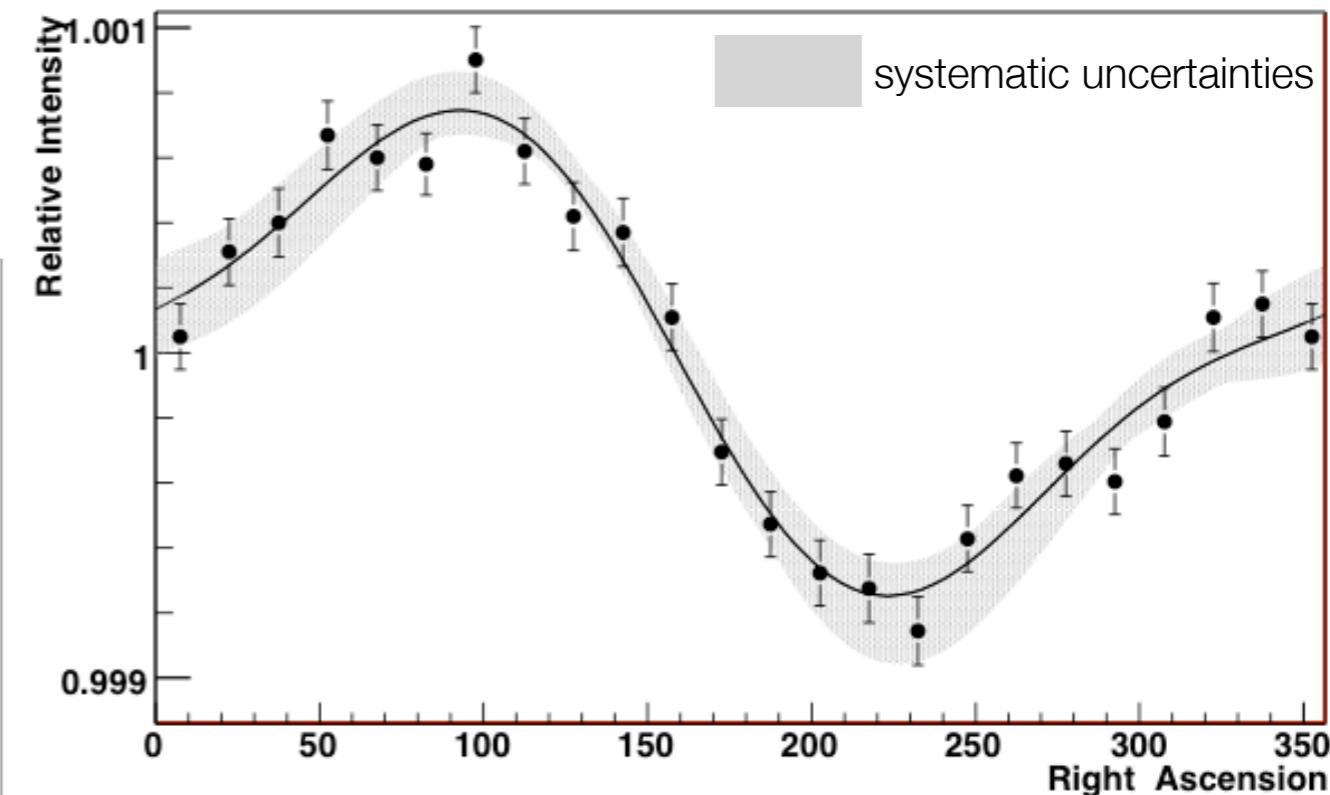

cosmic rays anisotropy

- ▶ measure relative CR variation in individual declination bands
- ▶ arrival direction anisotropy of $O(10^{-4})$

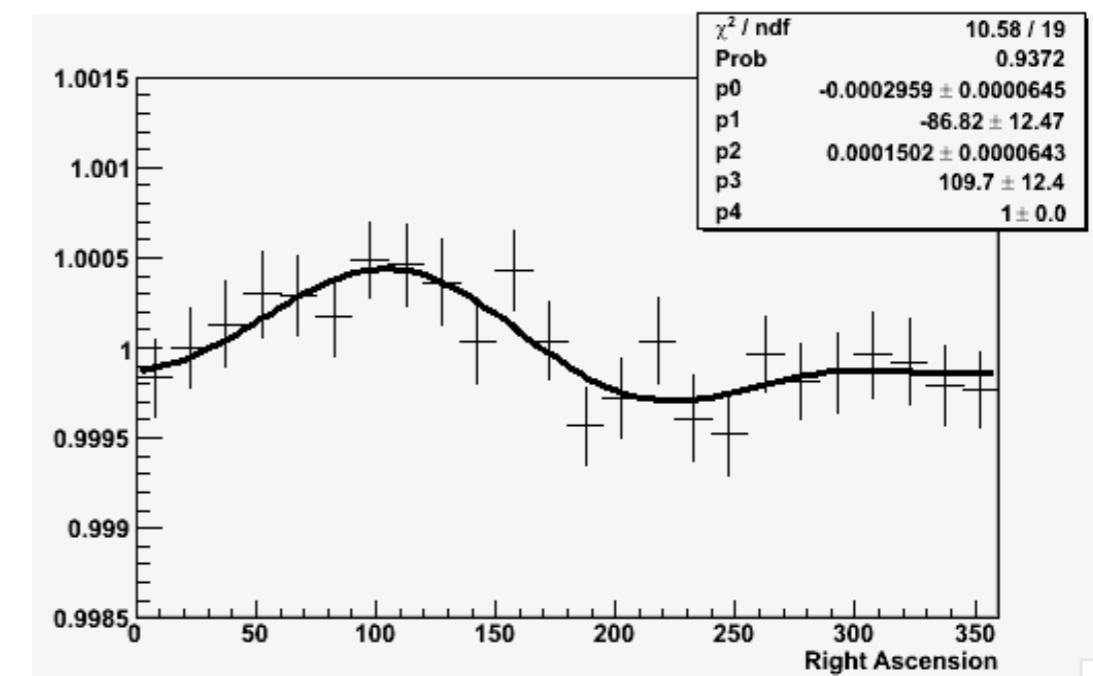

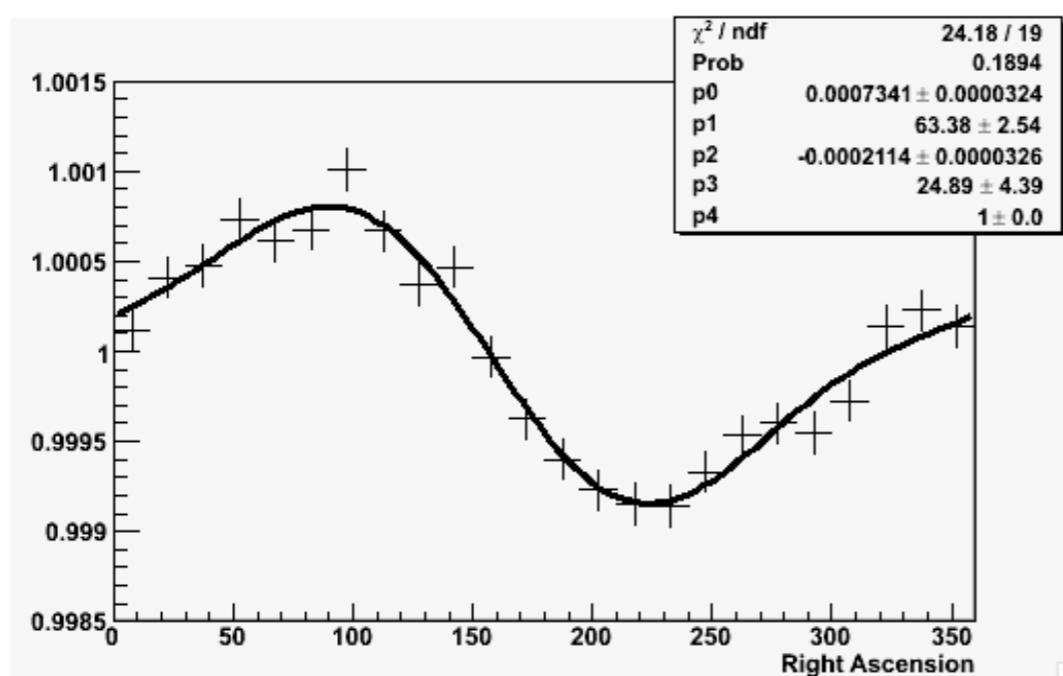

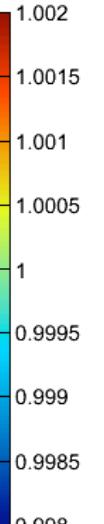

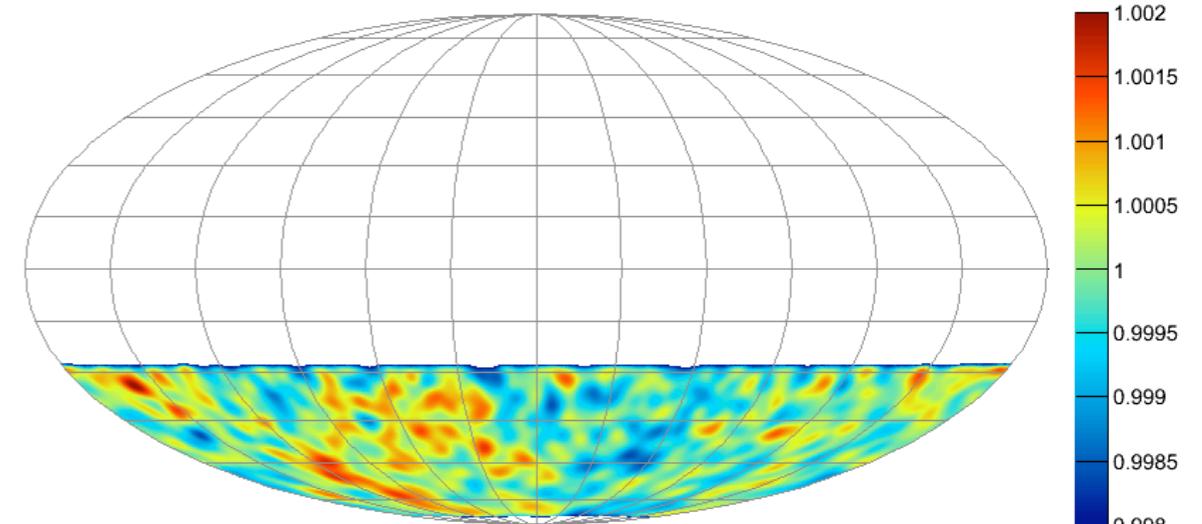

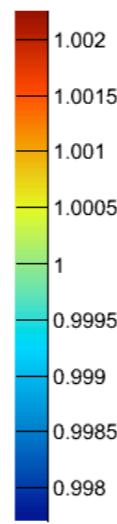

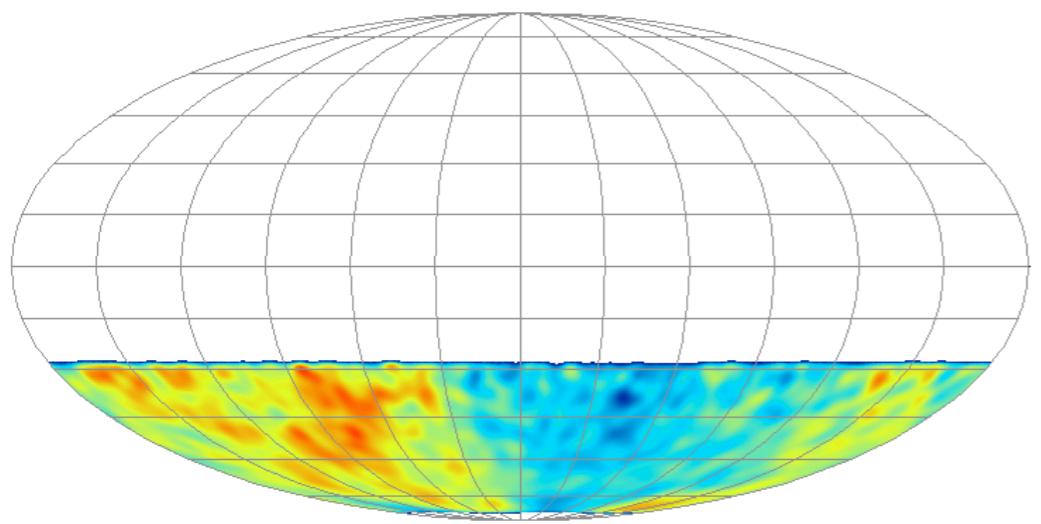

cosmic rays anisotropy

- ▶ measure relative CR variation in individual declination bands
- ▶ arrival direction anisotropy of $O(10^{-4})$

preliminary

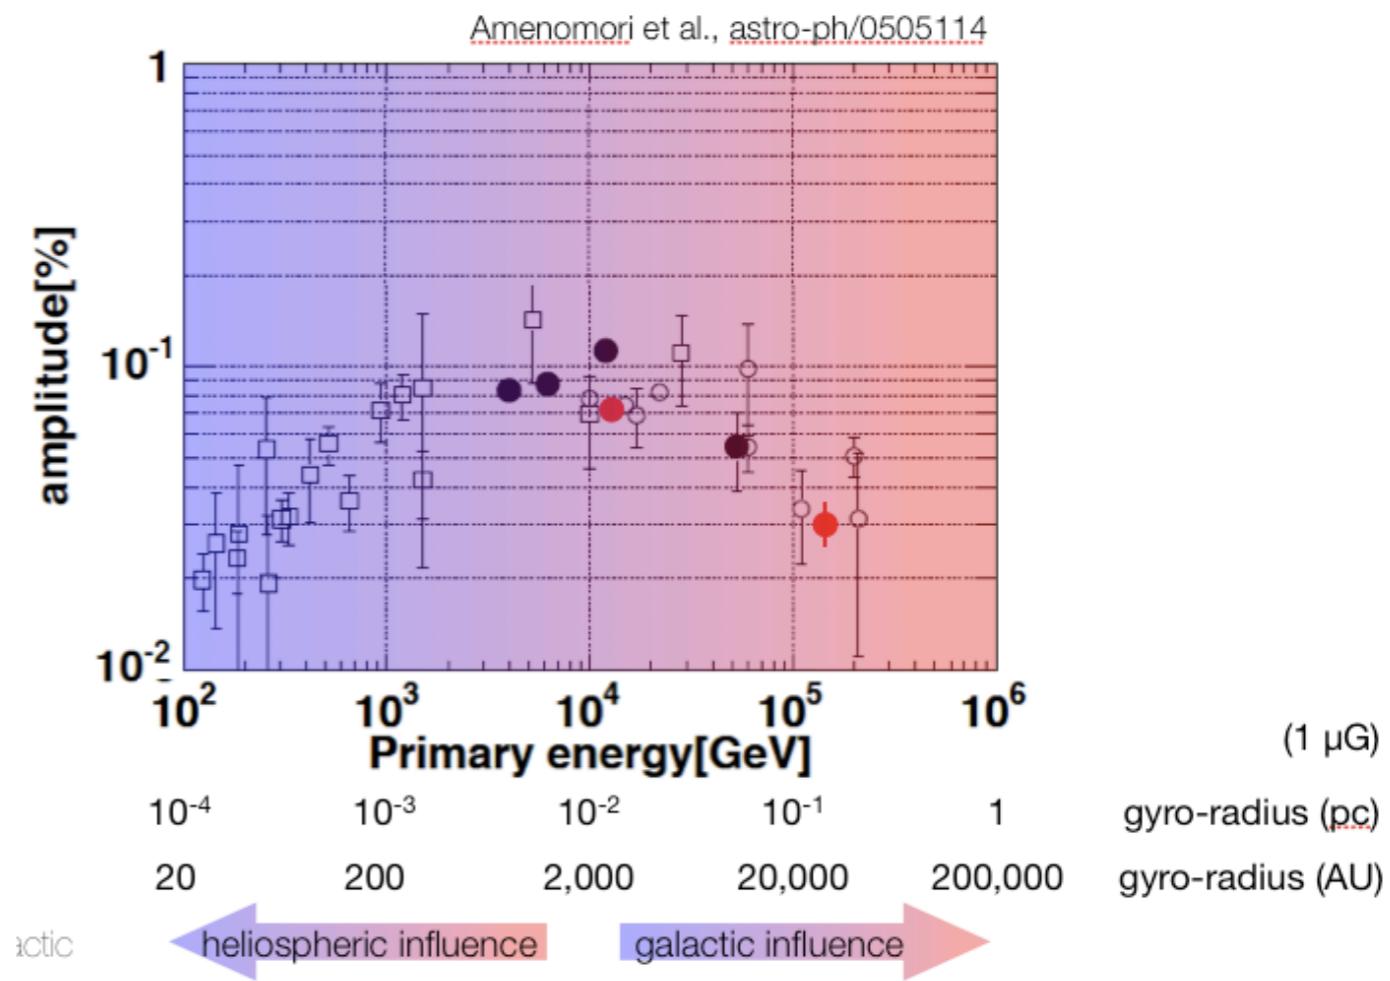

$E_{\text{median}} = 12 \text{ TeV}$

$E_{\text{median}} = 126 \text{ TeV}$

IceCube-22 : anisotropy persists at high energy

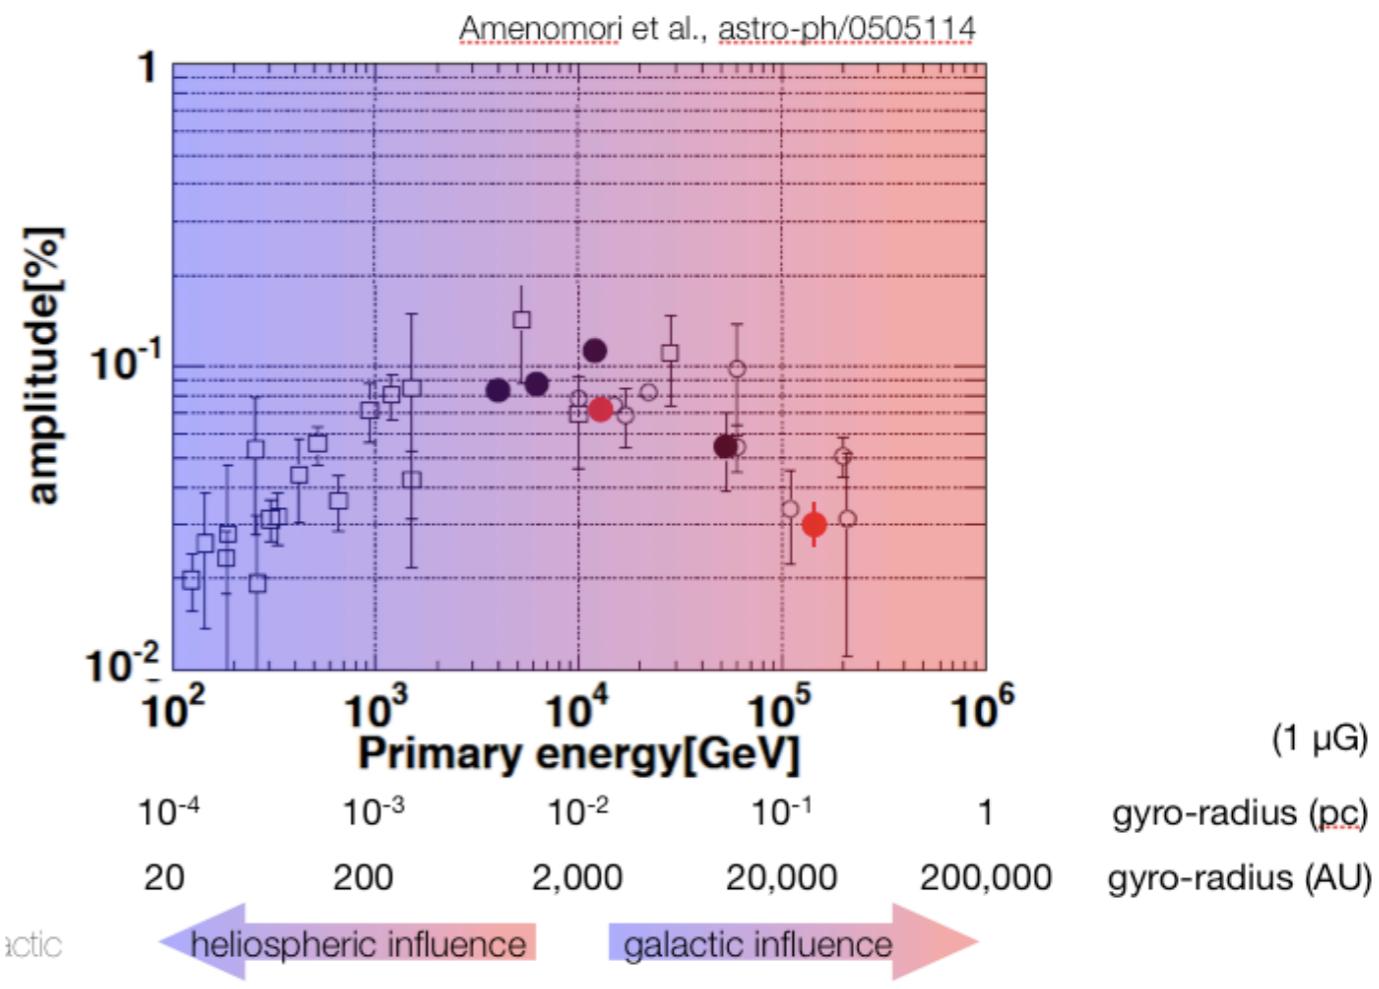

cosmic ray anisotropy

- probe for local environment
 - ▶ heliosphere \leq TeV
 - ▶ interstellar matter \gtrsim TeV
- properties of interstellar magnetic field
 - ▶ galactic neighborhood (~ 1 pc)
 - ▶ diffusion of cosmic rays

cosmic ray anisotropy

- probe for local environment
 - ▶ heliosphere \lesssim TeV
 - ▶ interstellar matter \gtrsim TeV
- properties of interstellar magnetic field
 - ▶ galactic neighborhood (~ 1 pc)
 - ▶ diffusion of cosmic rays
- connection to the origin of CR : contribution of nearby *recent* SN explosions
 - ▶ single source contribution to the knee of CR spectrum

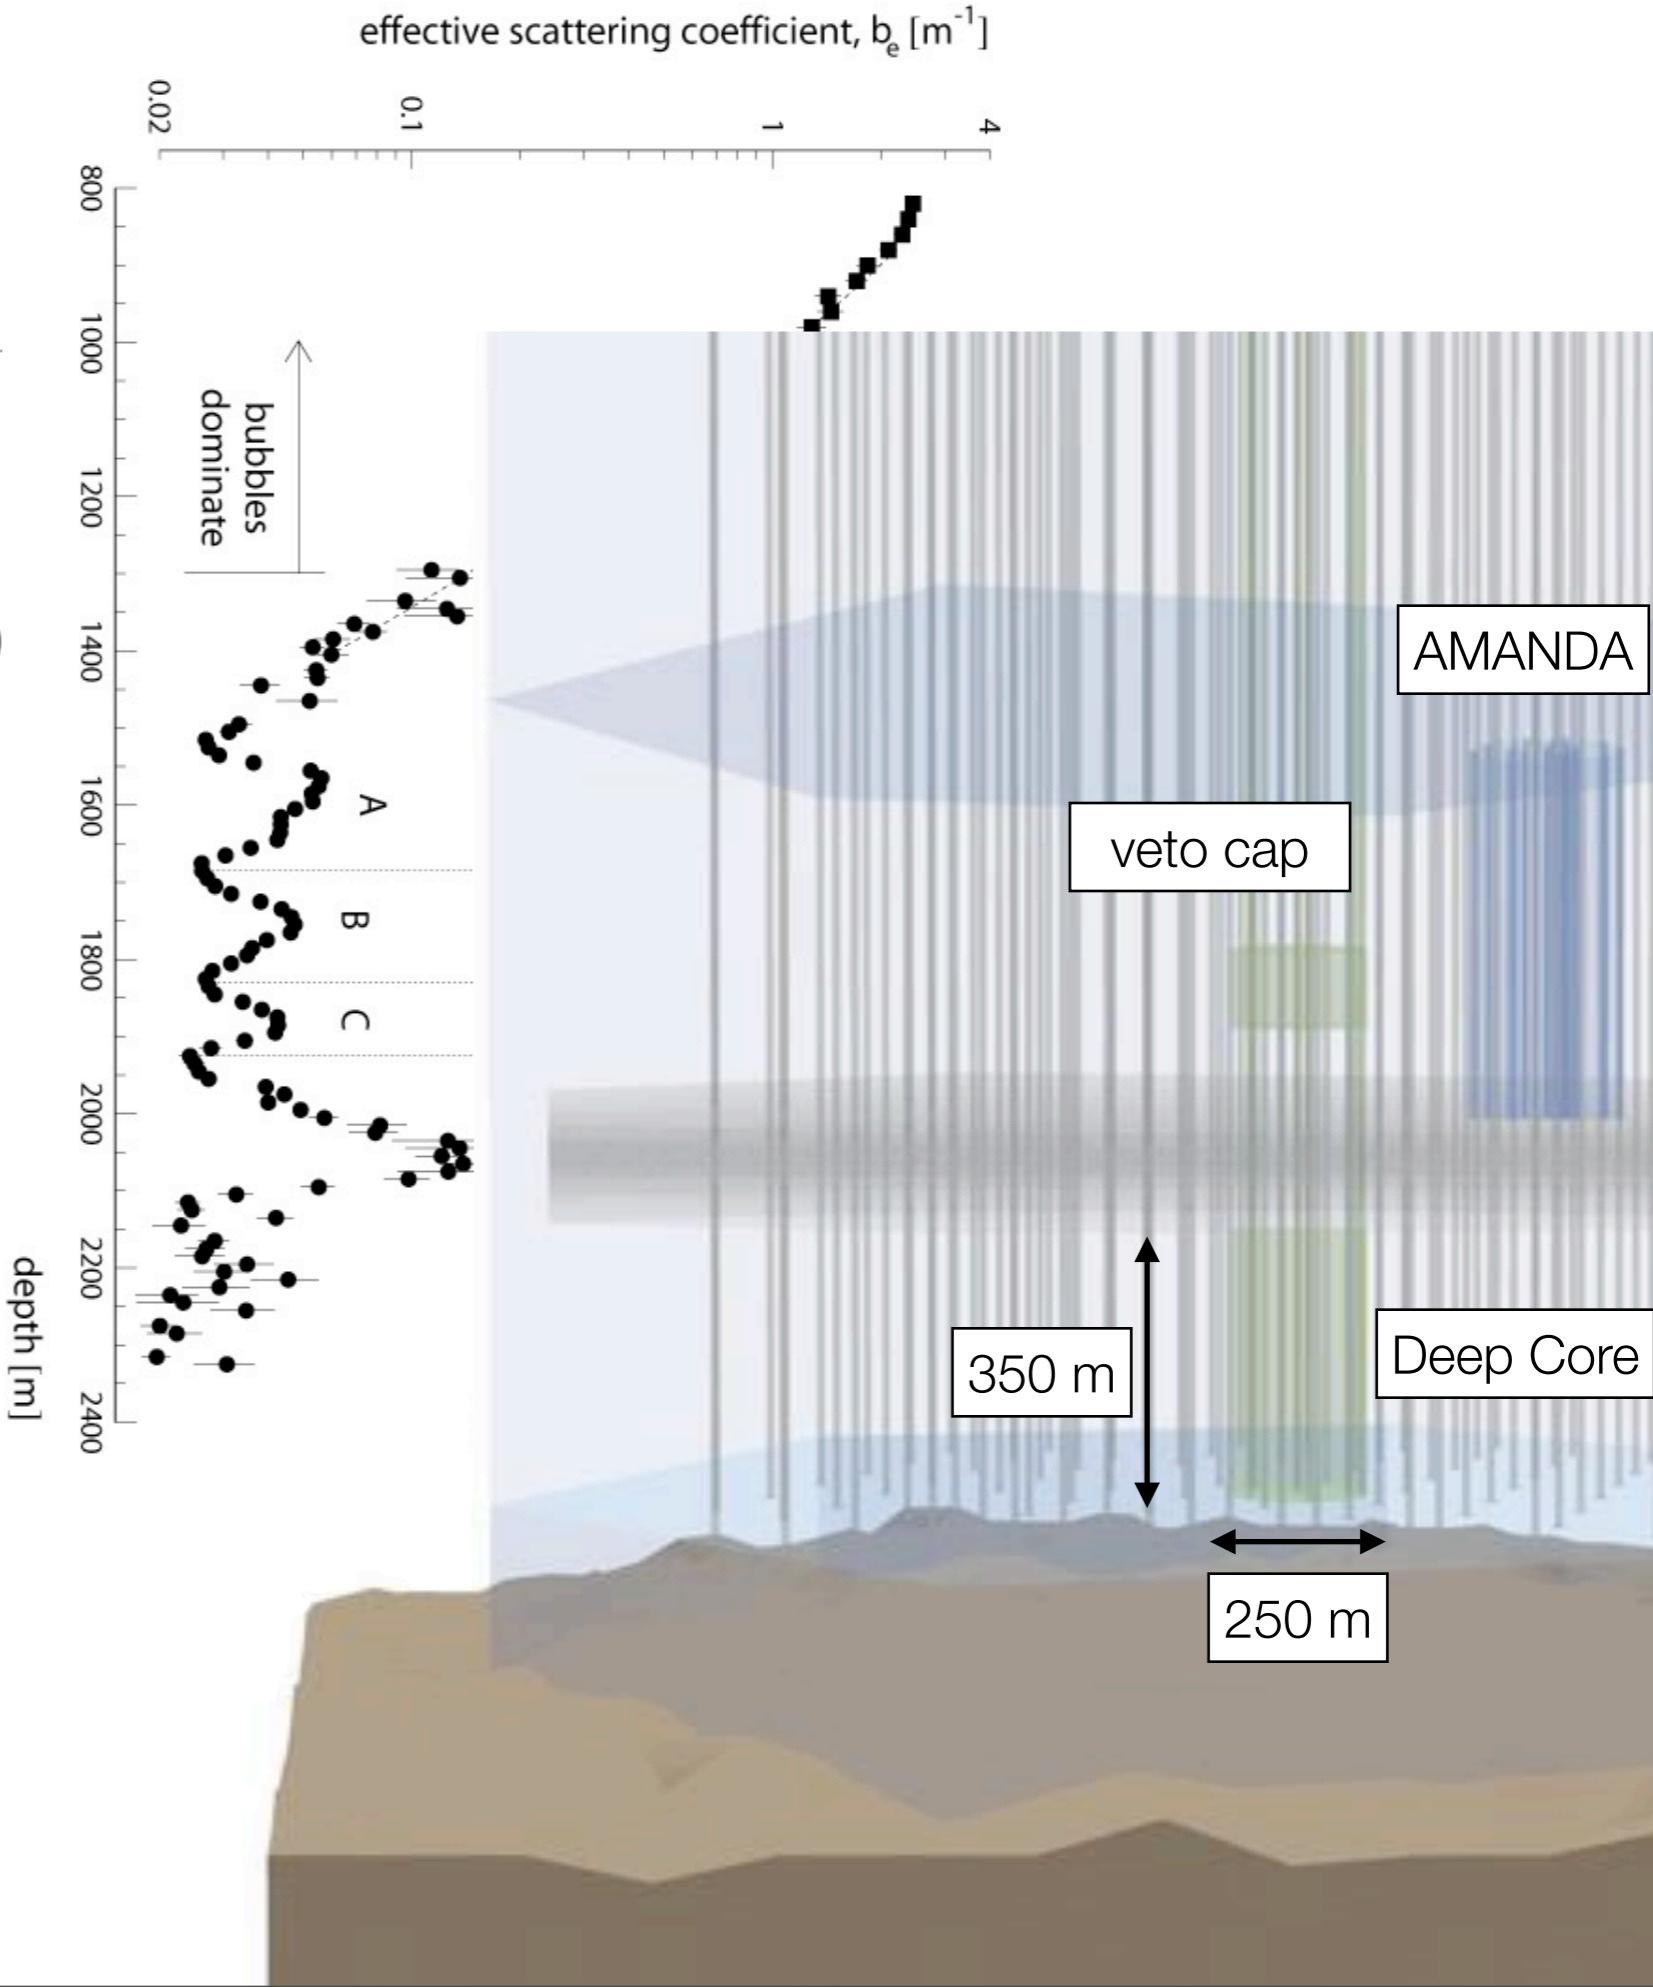

summary

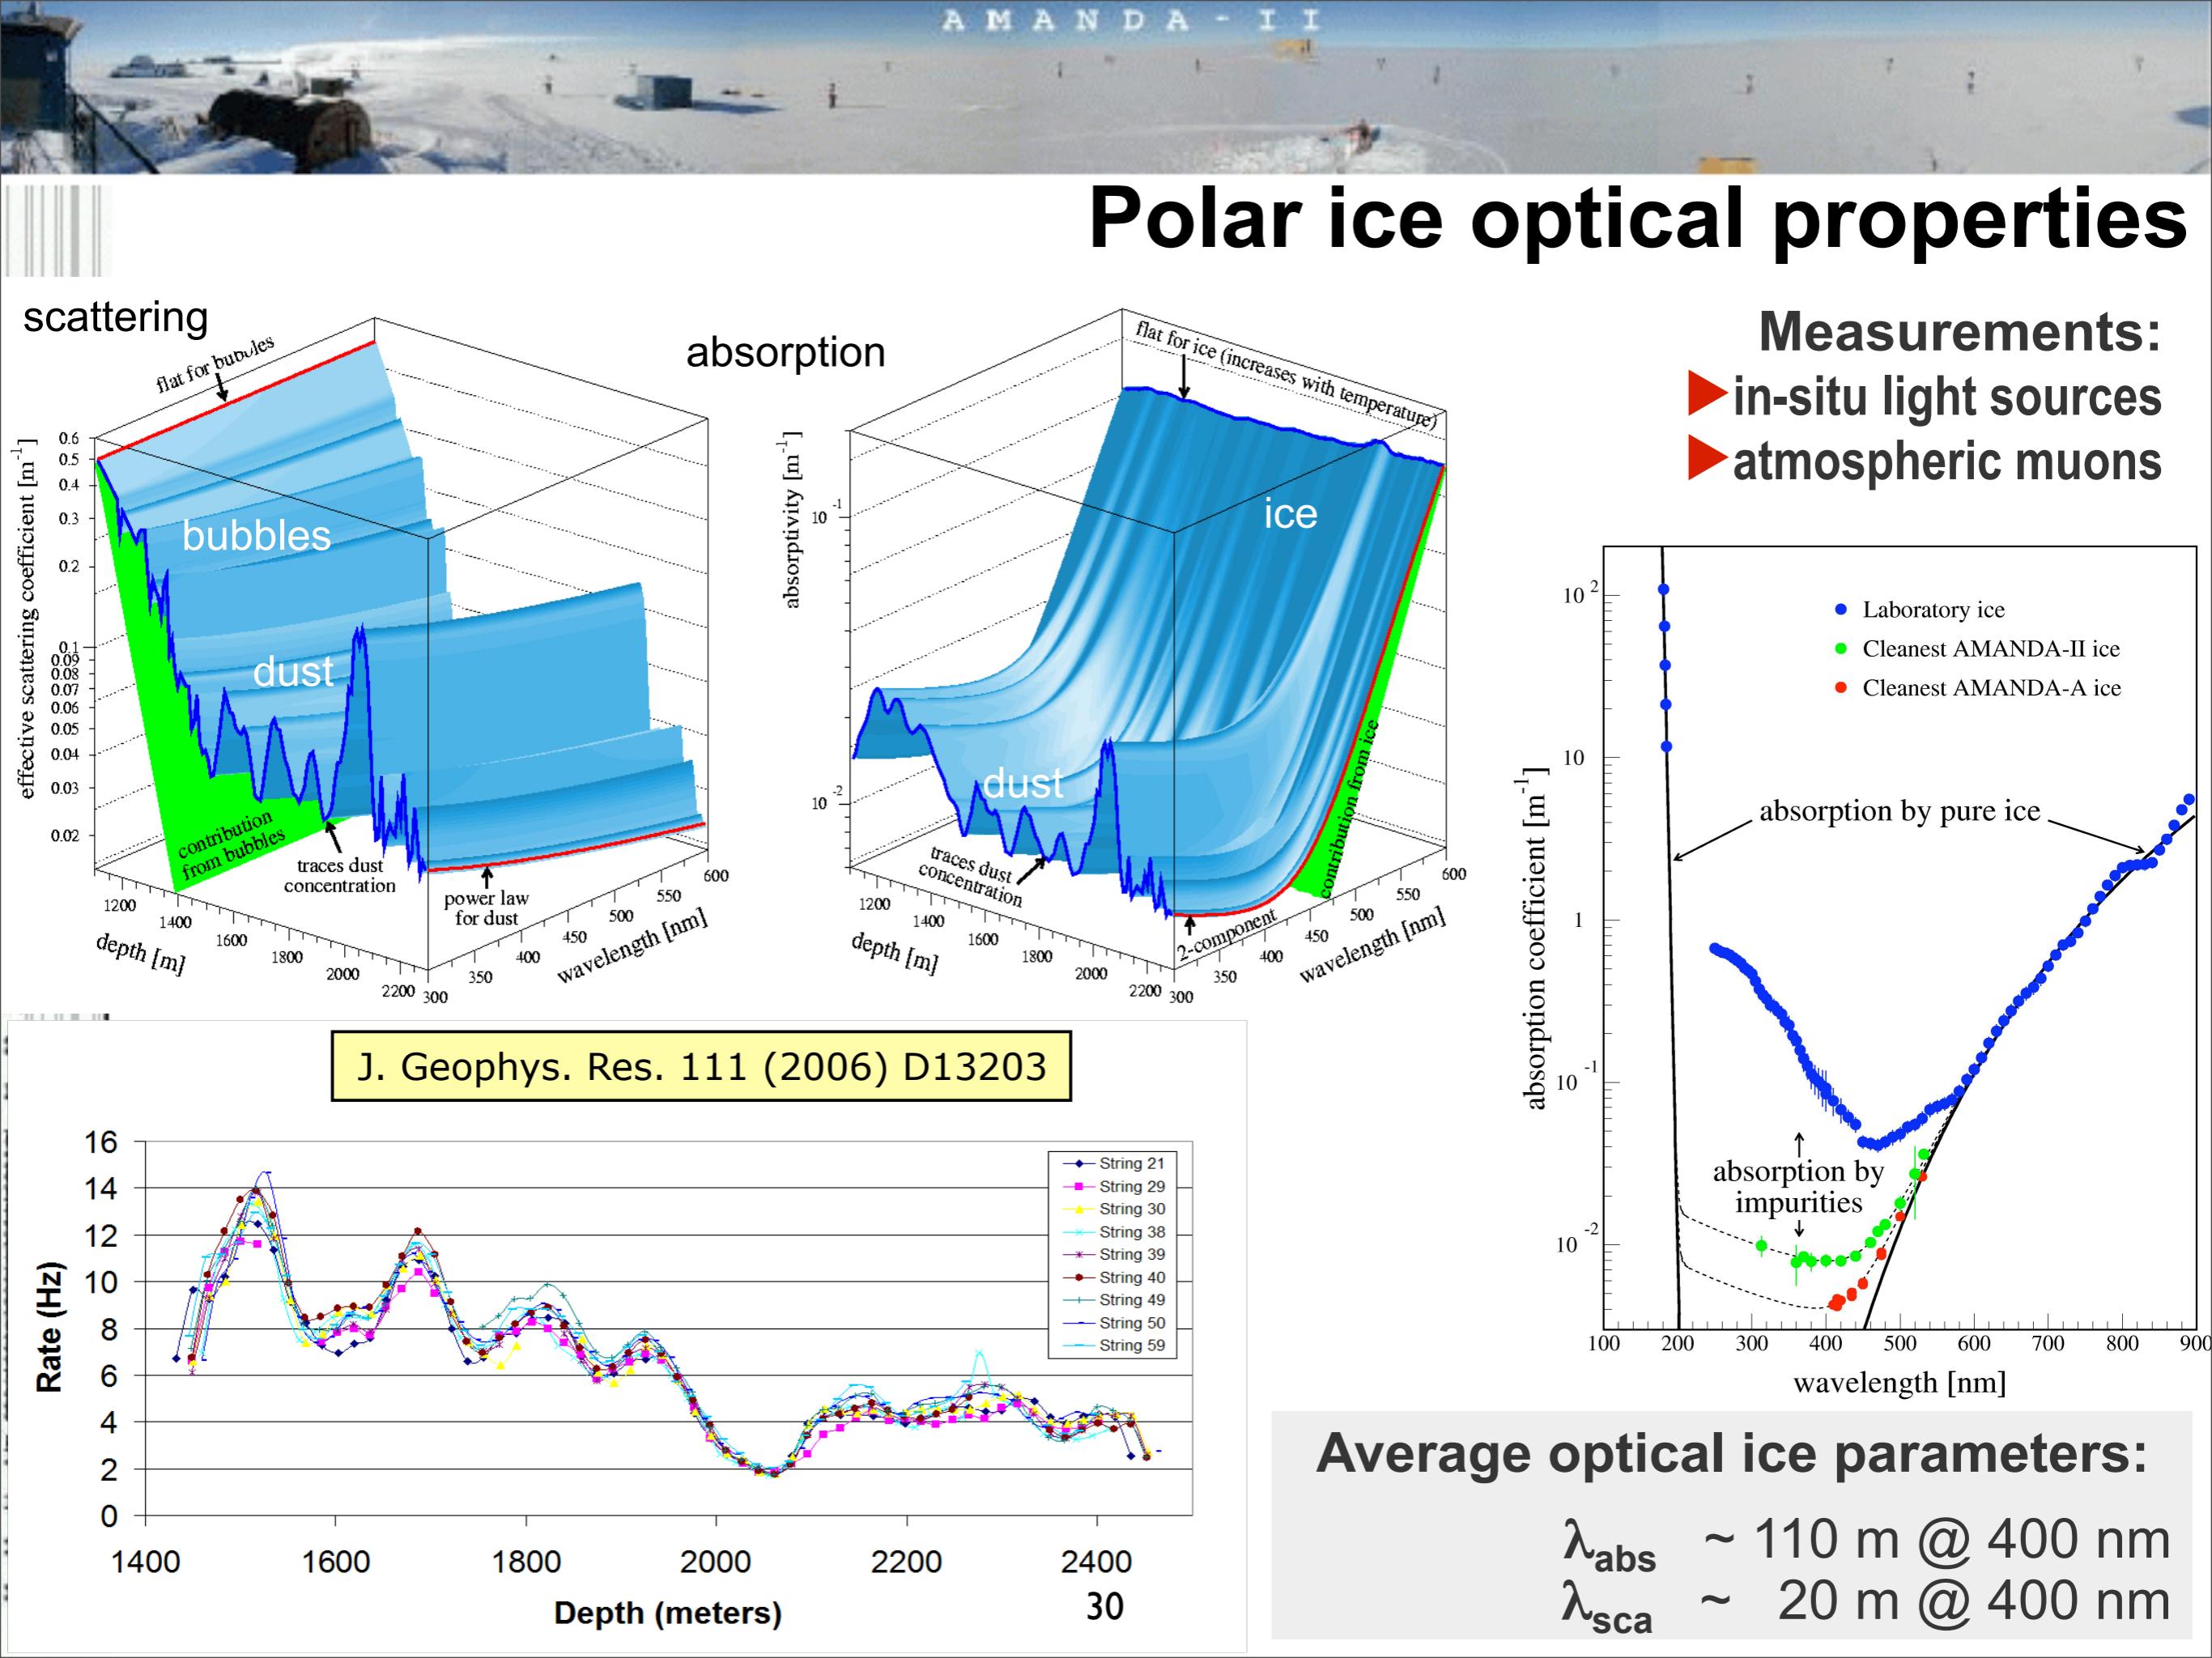

- IceCube will be completed at the beginning of 2011 : 86 strings
 - lower energy threshold with Deep Core : ~ 30 GeV
- sensitivity for neutrino searches will improve at least $\times 2$ wrt IC-40
 - search of extended sources, UHE, EHE neutrinos
 - too soon to invoke *non standard* models
- search for non-std particle physics & indirect search for dark matter
- cosmic ray anisotropy as probe of local IS environment or of origin of CR's
 - energy dependence, small angular scale

backup slides

Deep Core

- 6 dedicated + 7 IceCube strings
 - 72m inter-string spacing (125m)
 - 7m DOM spacing (17m)
 - high QE PMT (38% higher)
 - ▶ $\gtrsim 5\times$ effective photocathode density
- IceCube as veto + veto cap
- in the clearest ice
 - $\lambda_{\text{atten}} \sim 40\text{-}45\text{m}$ (cf. 20-25m in shallower ice)

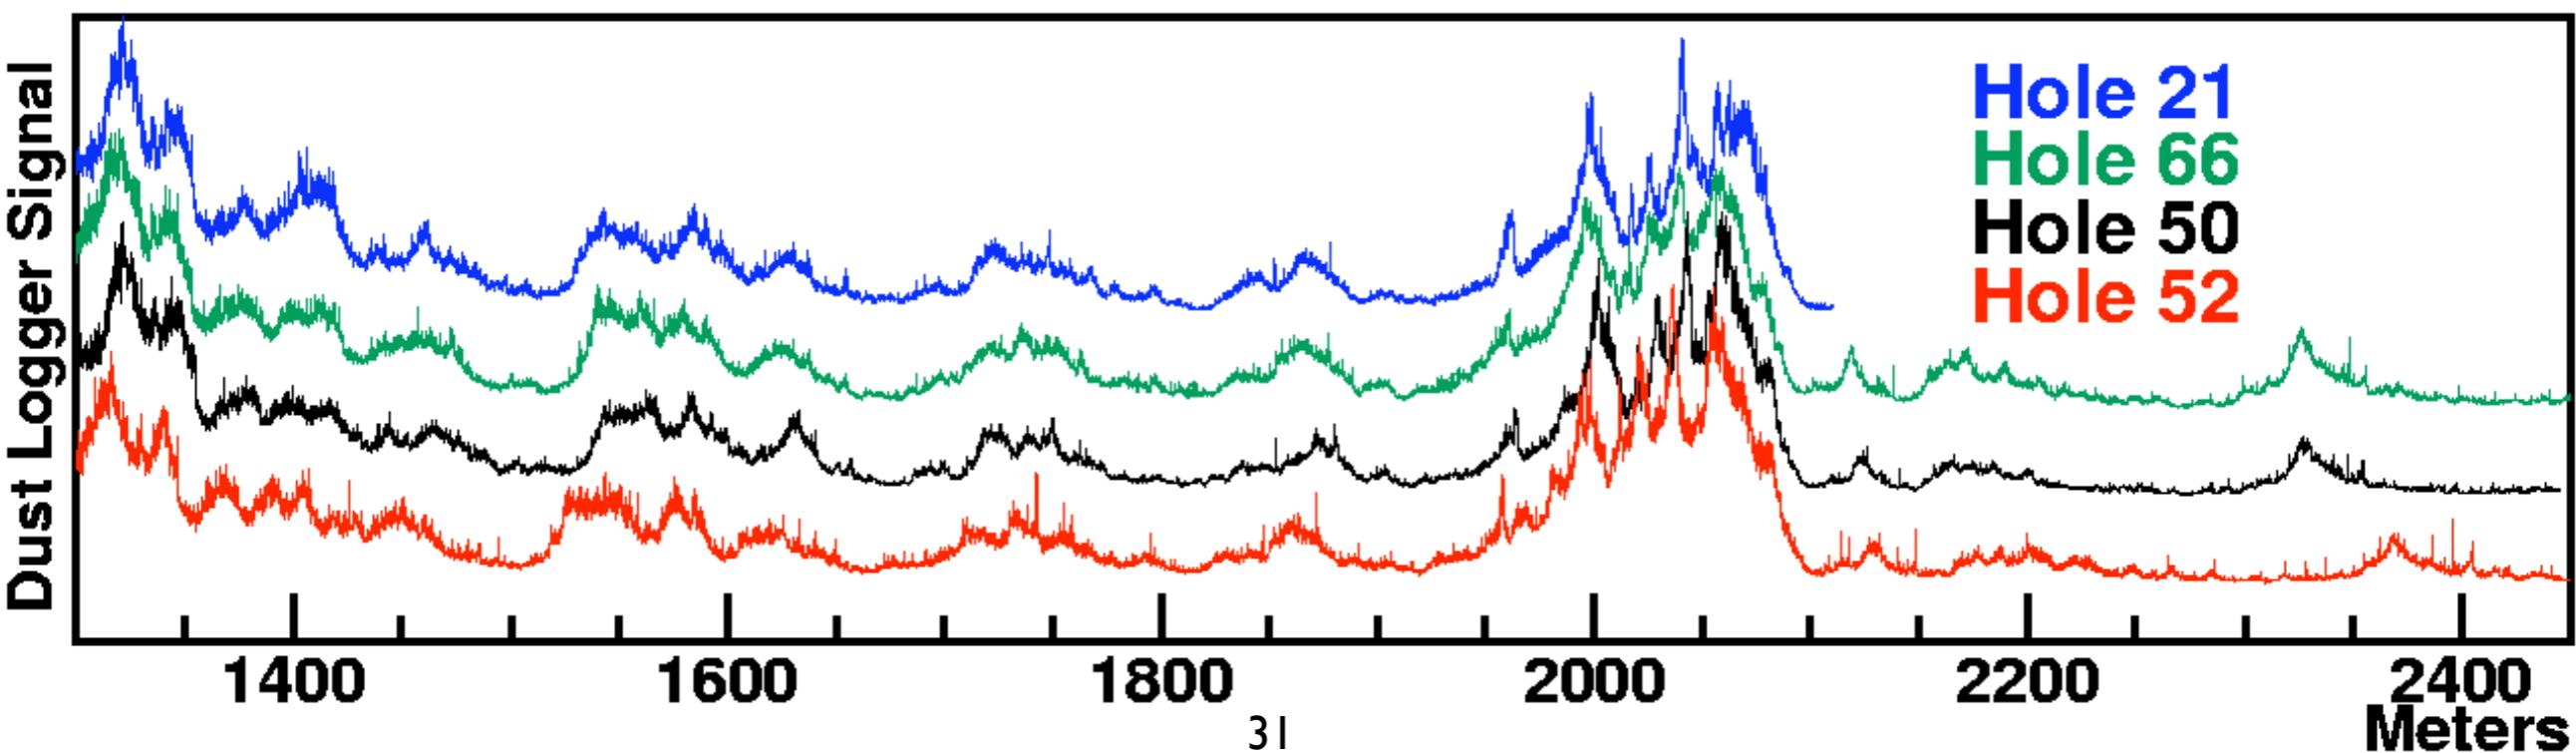

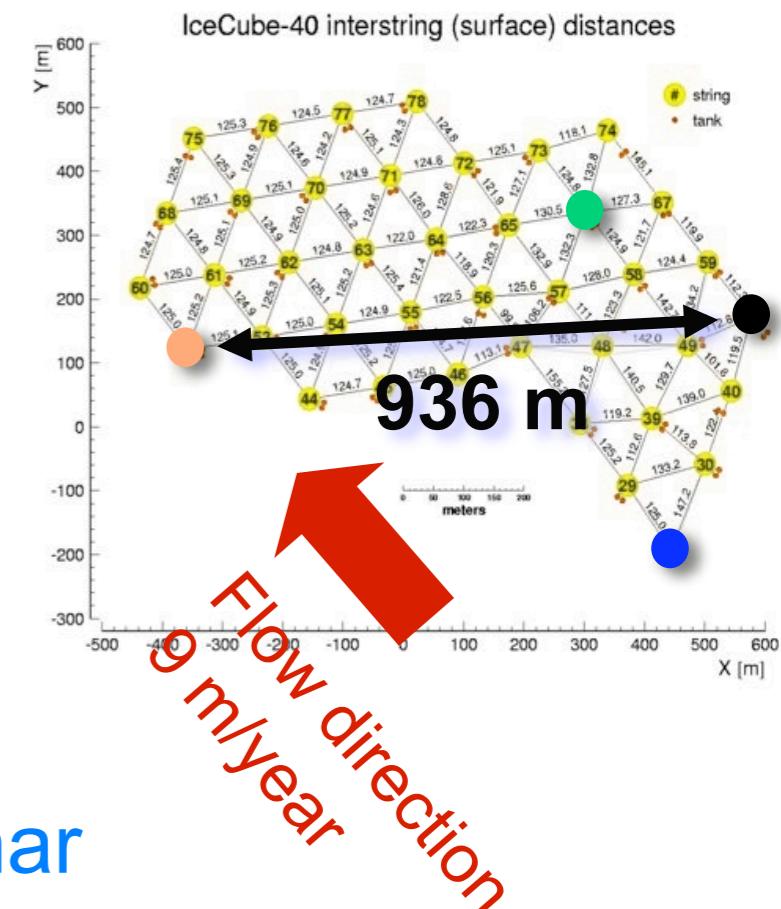

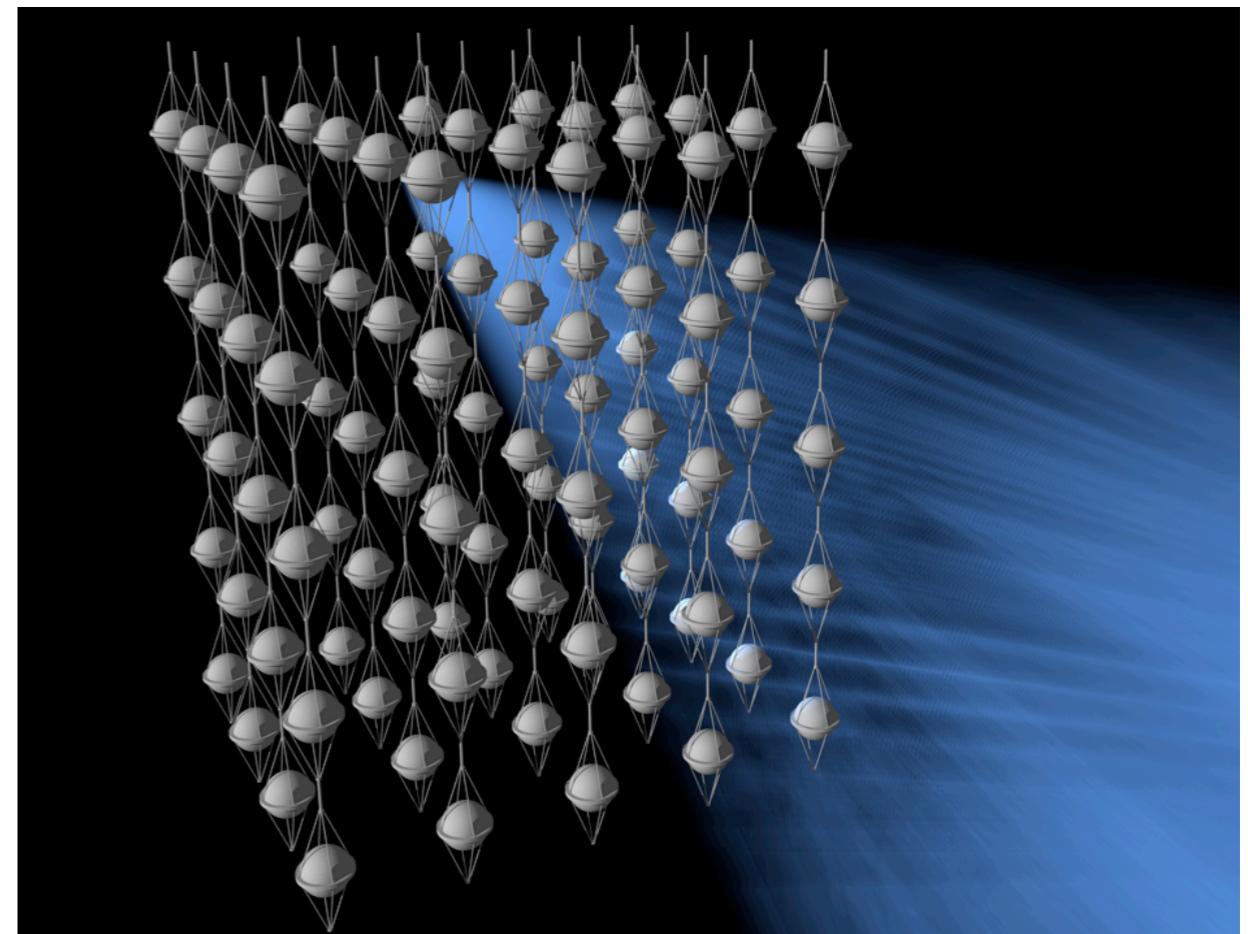

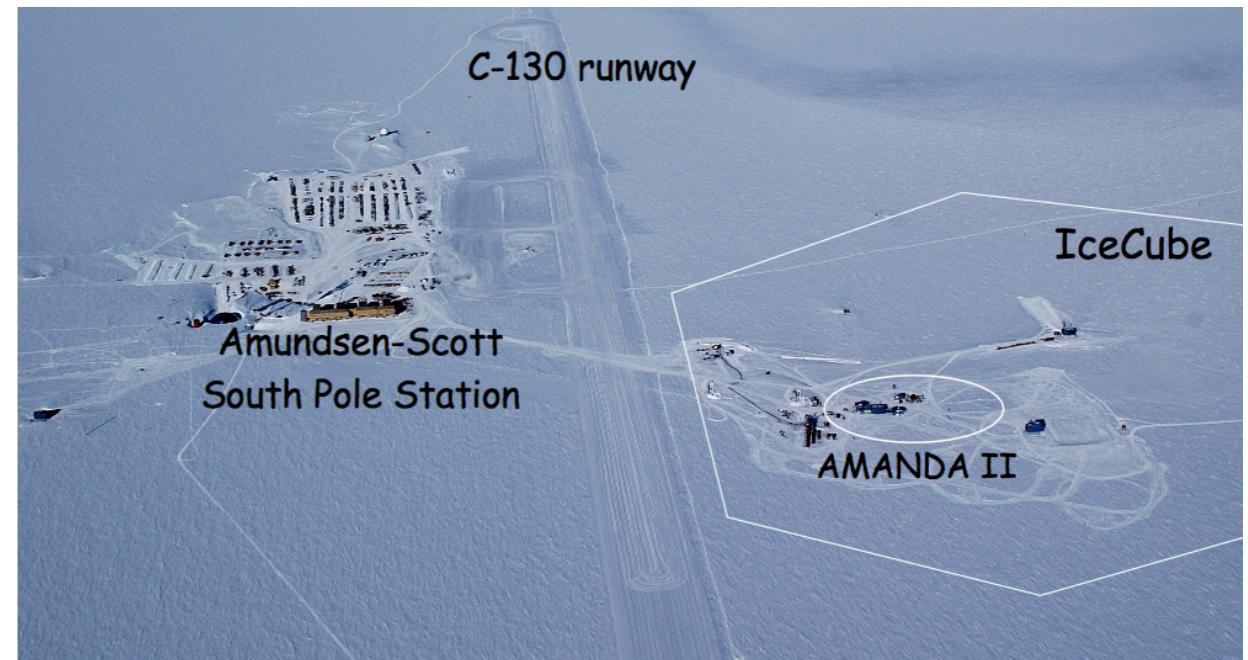

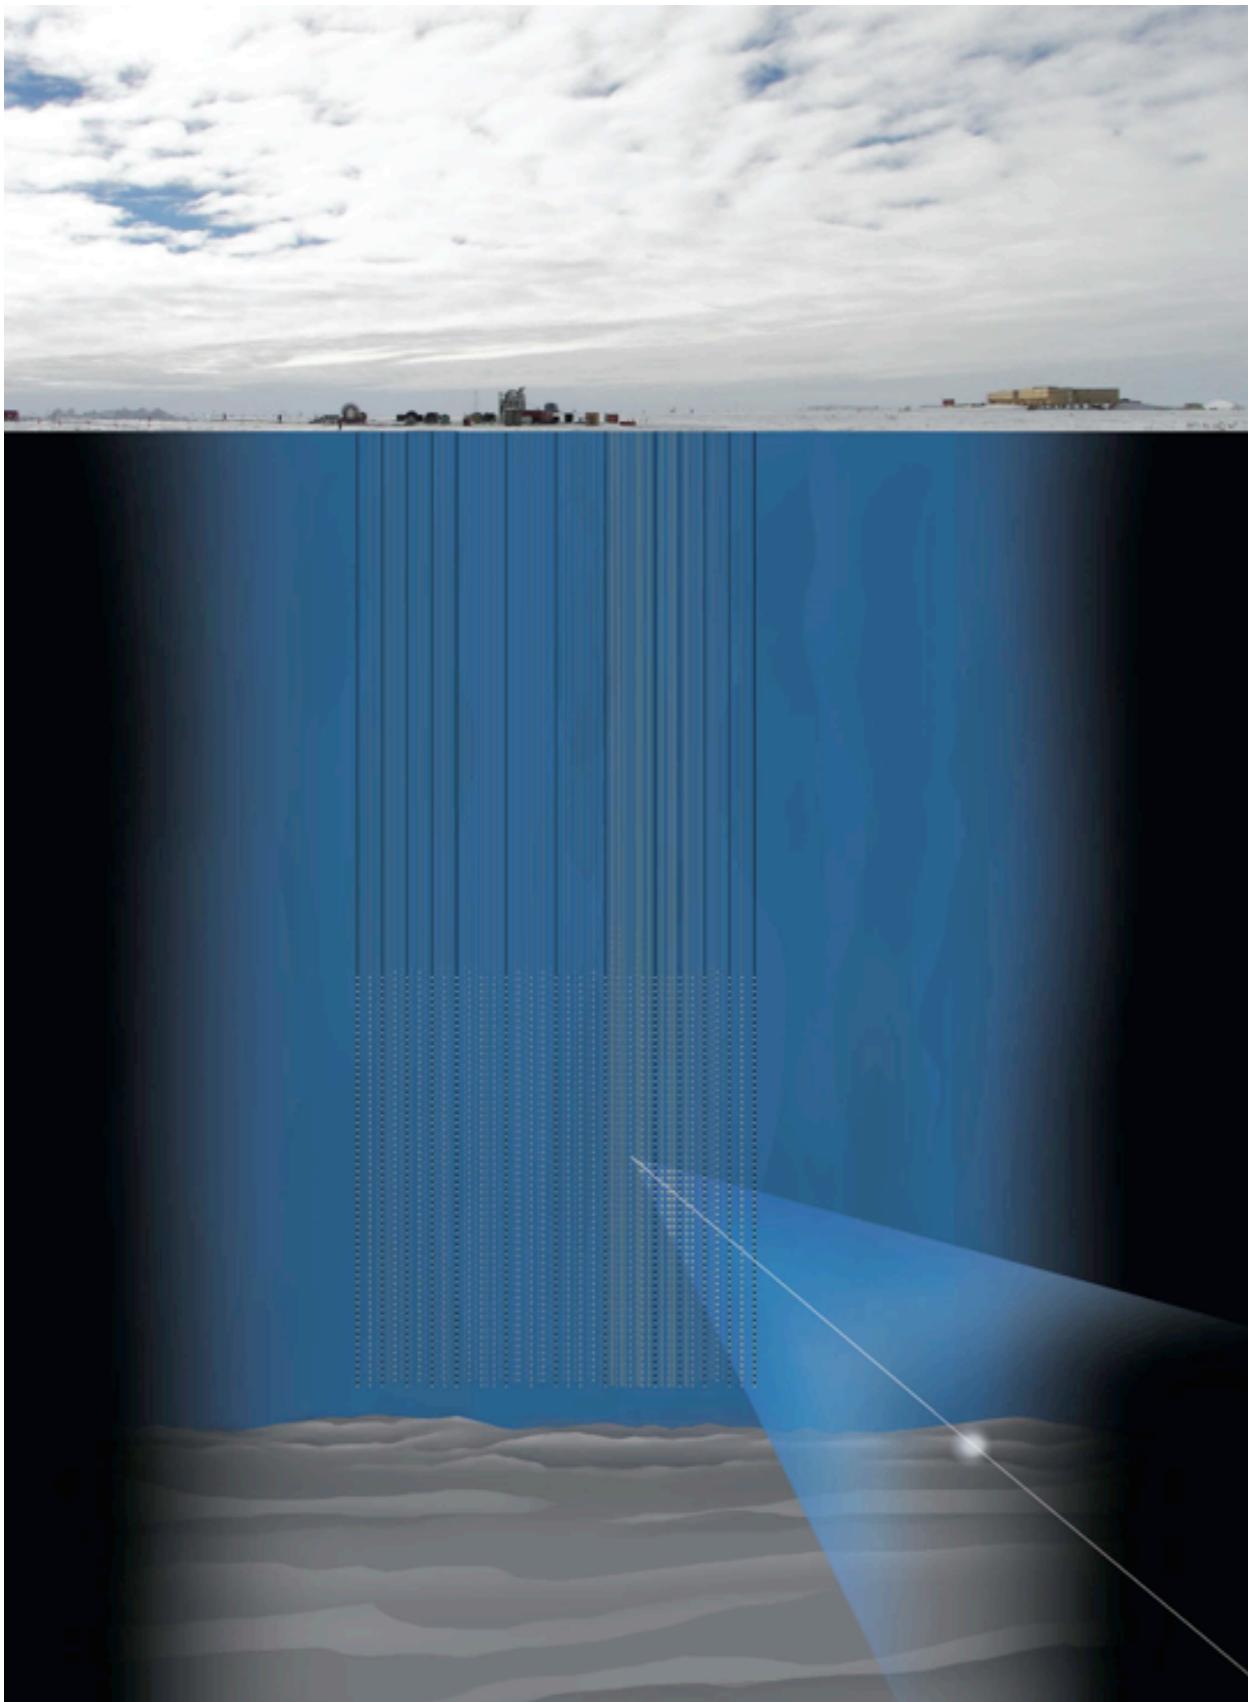

Ice Properties

- Analyses are sensitive to the optical properties of the ice.
- Below 1400 m, dominated by impurities in the ice
- Measure with 'dust logger'
 - Ice layers are not completely planar
 - Up to 70 m/km tilt

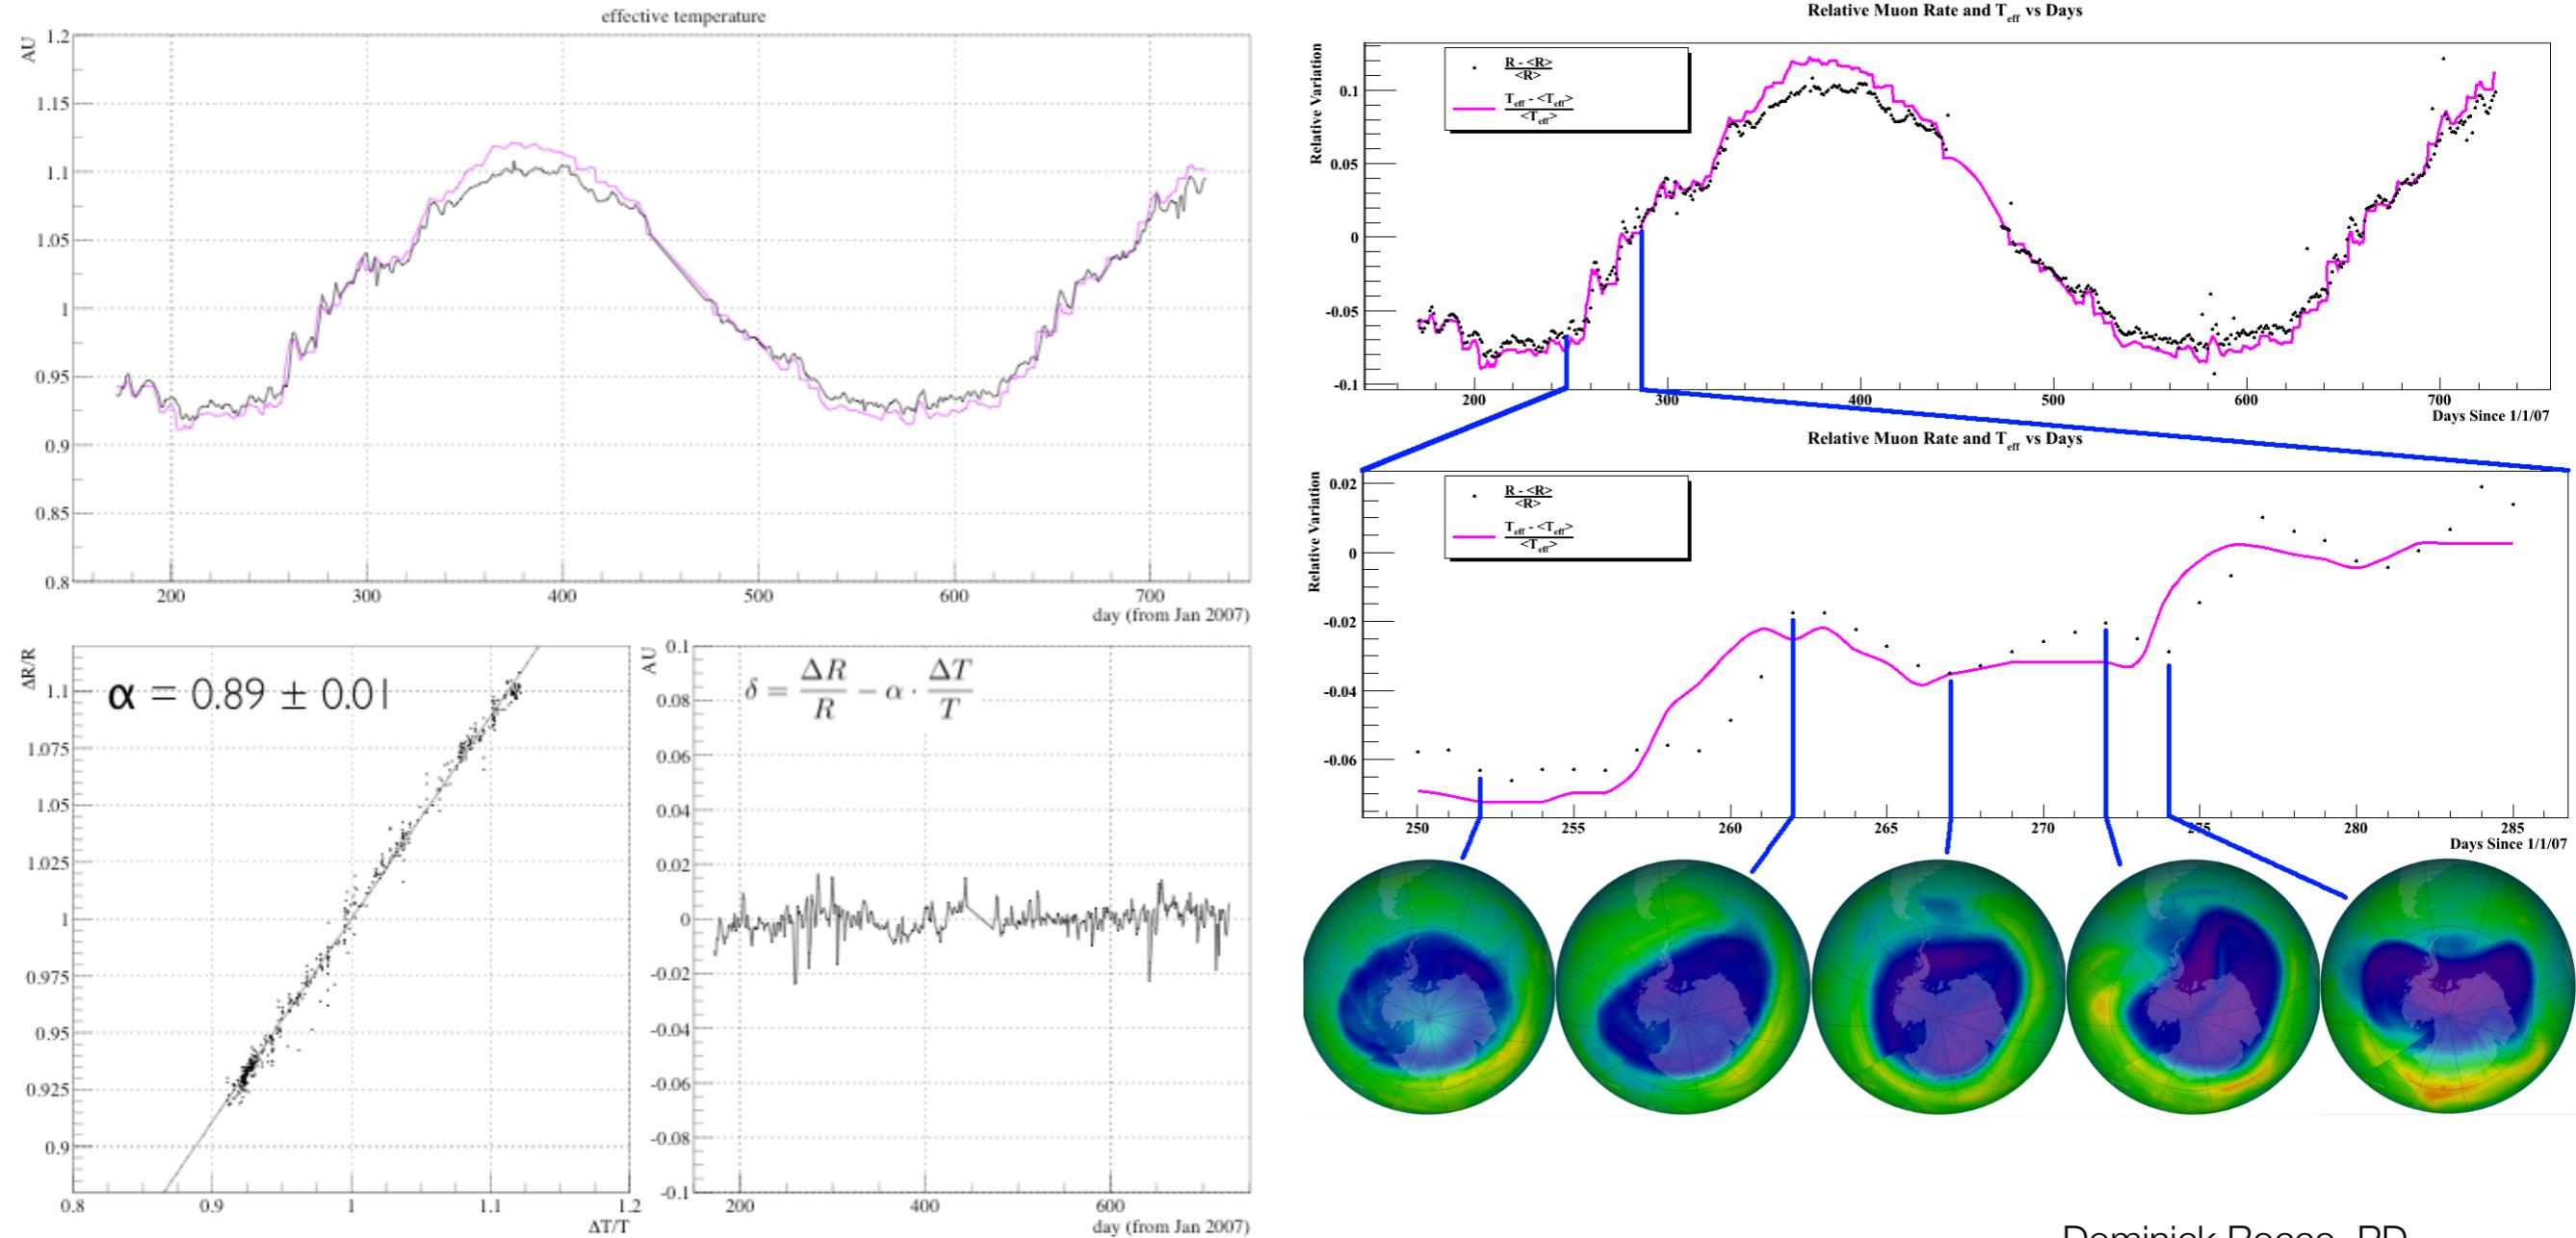

detection technique

growing IceCube

Strings	Year	Livetime	μ rate	ν rate
IC9	2006	137 days	80 Hz	1.7 / day
IC22	2007	275 days	550 Hz	28 / day
IC40	2008	~365 days	1000 Hz	110 / day
IC59	2009	~365 days	1500 Hz	160 / day
IC86*	2011	~365 days	1650 Hz	220 / day

seasonal variations in IceCube

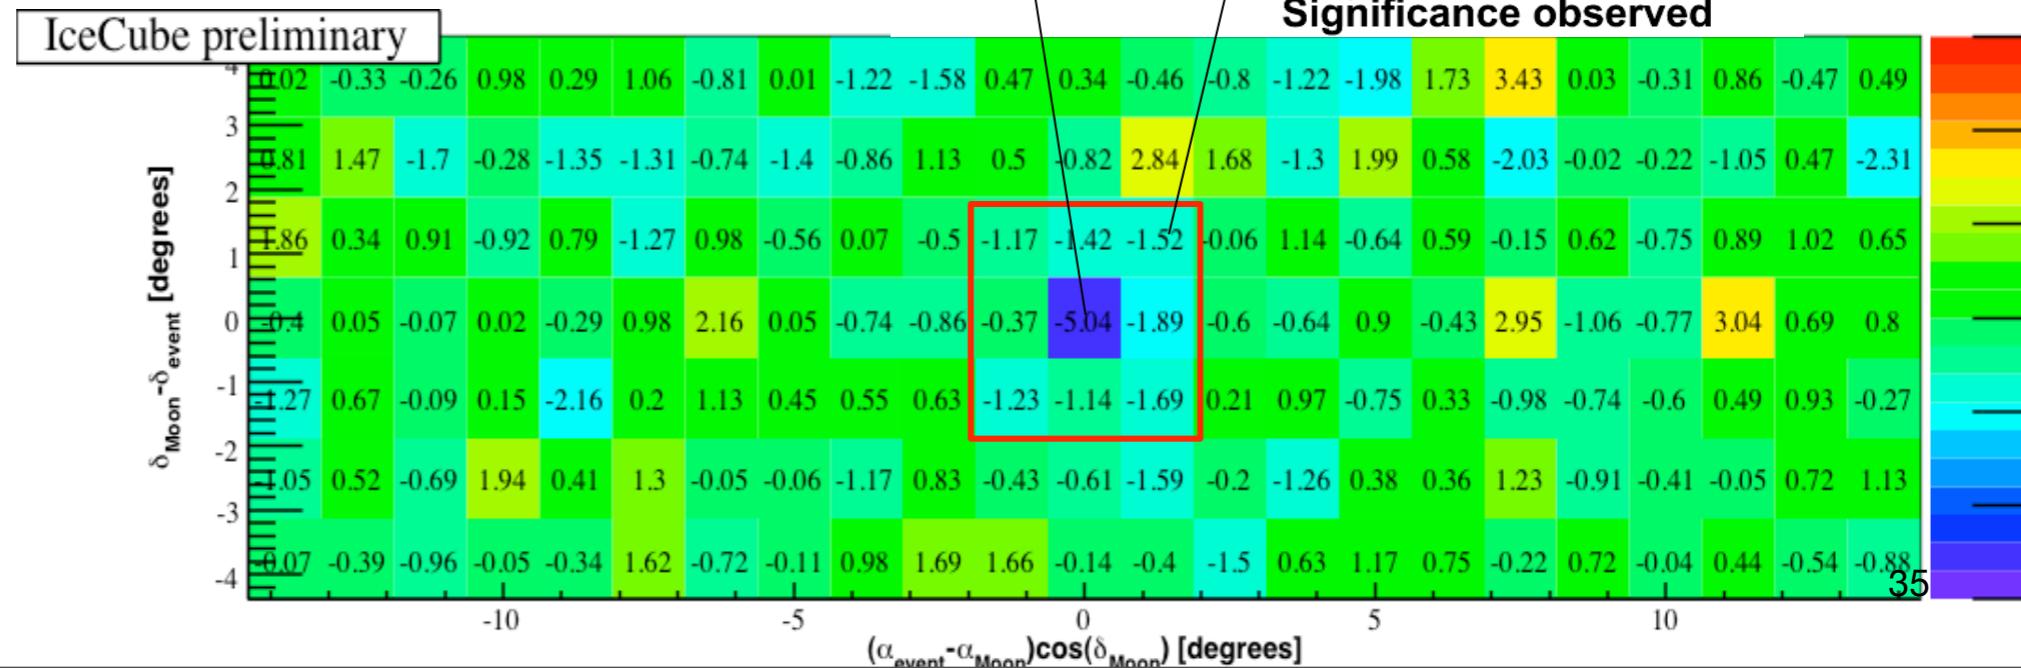

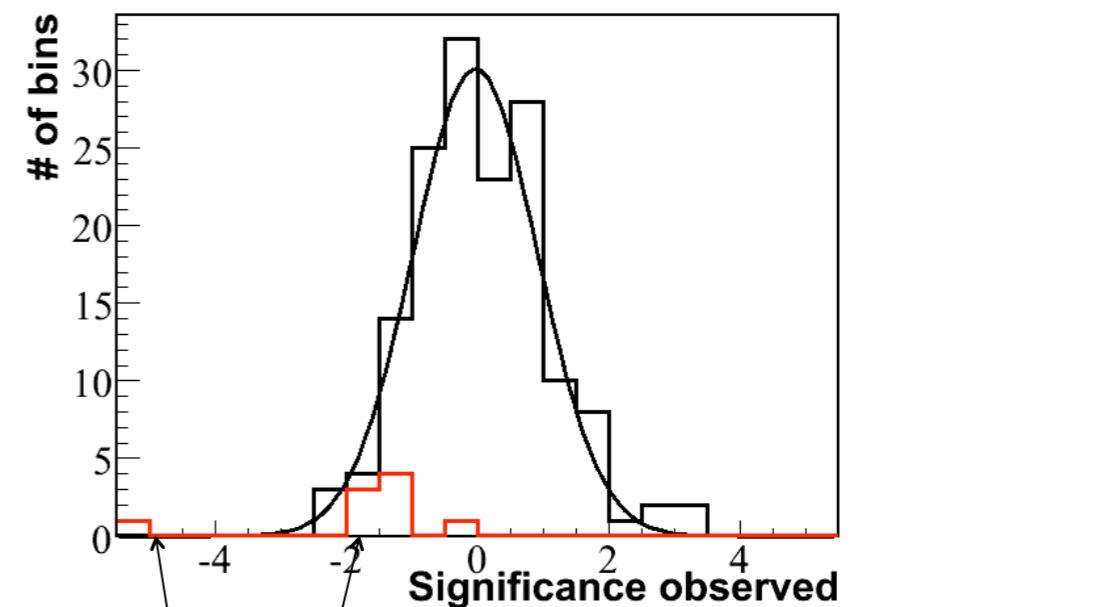

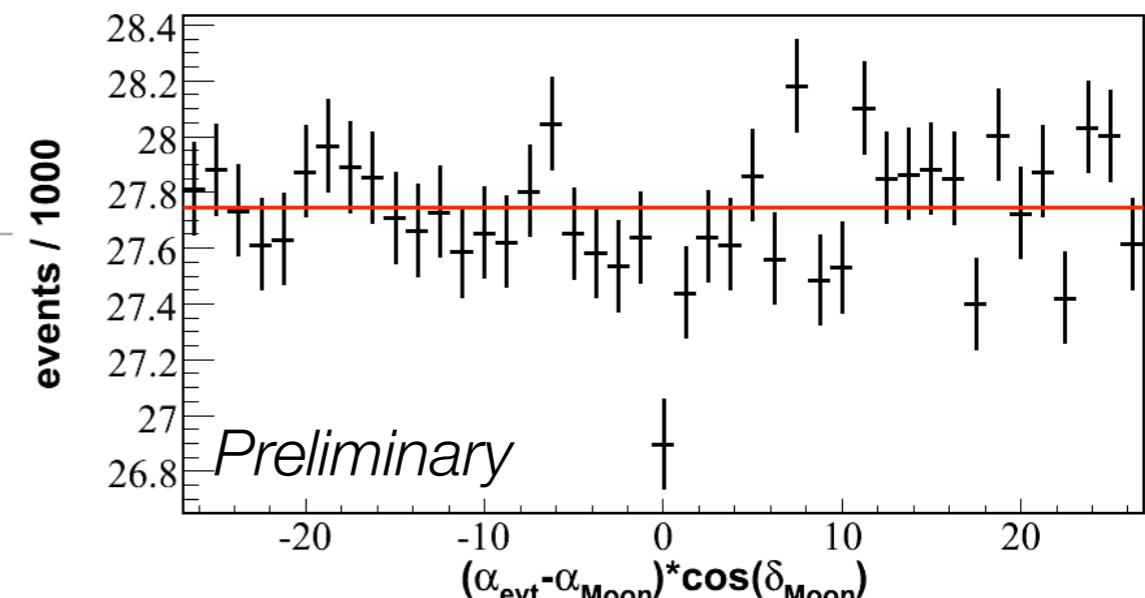

Dominick Rocco, PD

S. Tilav et al., arXiv:1001.xxxx

Moon shadow

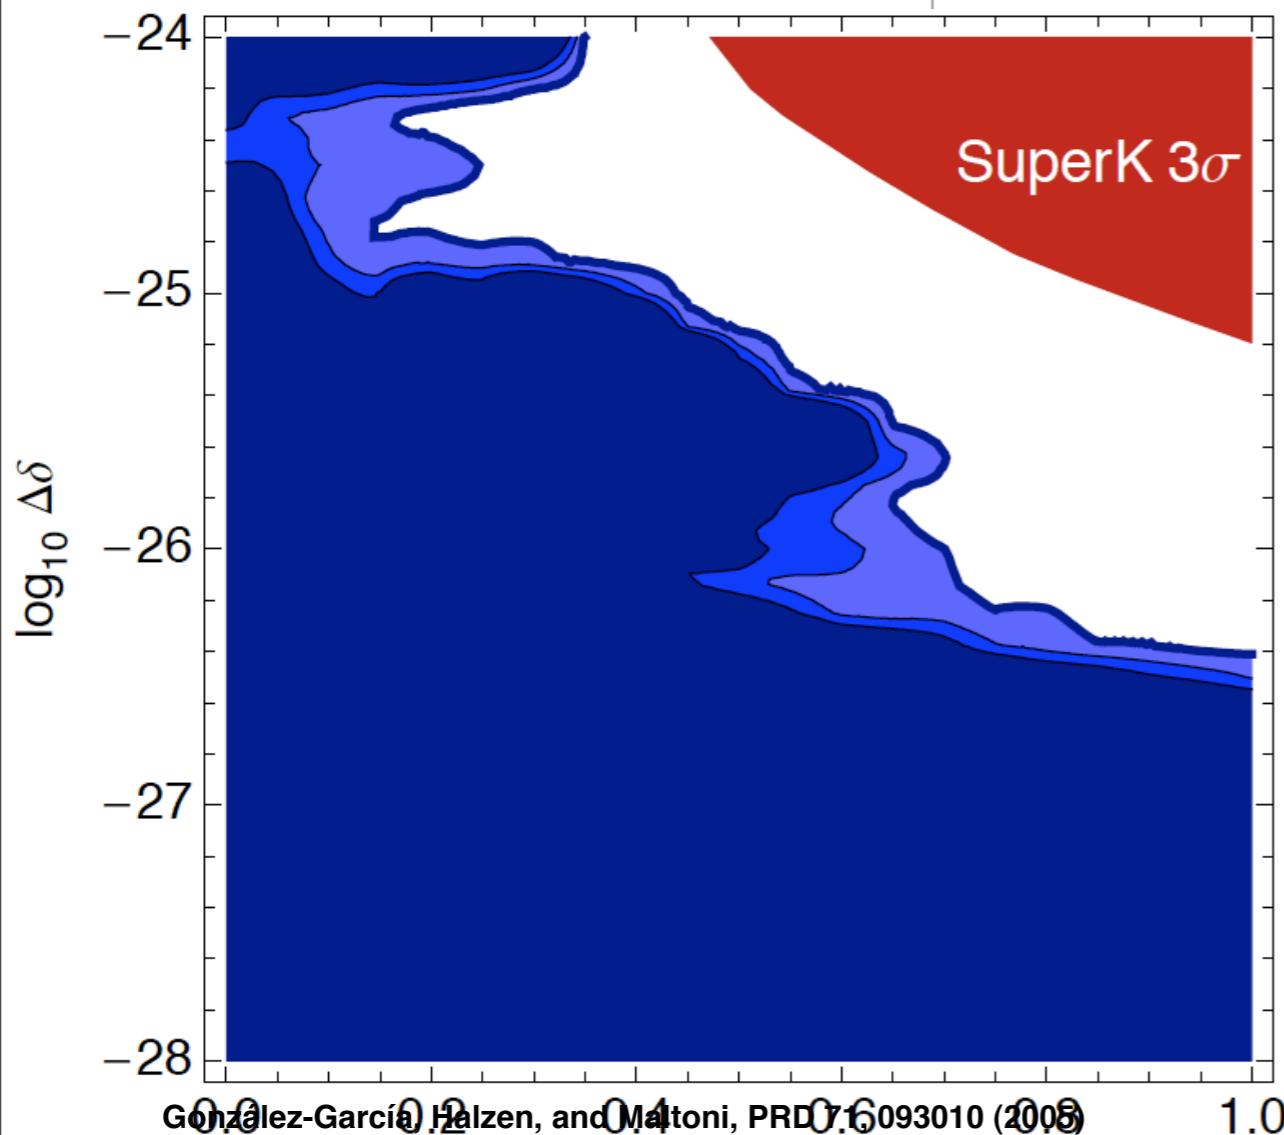

- 5 months of IC40
- Moon max. altitude at the South Pole (2008): 28°
- Median primary cosmic ray energy: 30TeV
- Deficit: 5 σ (~ 900 events of ~ 28000) - consistent with expectation.
- Verification of angular resolution and absolute pointing.
- More statistics will allow study of angular response function

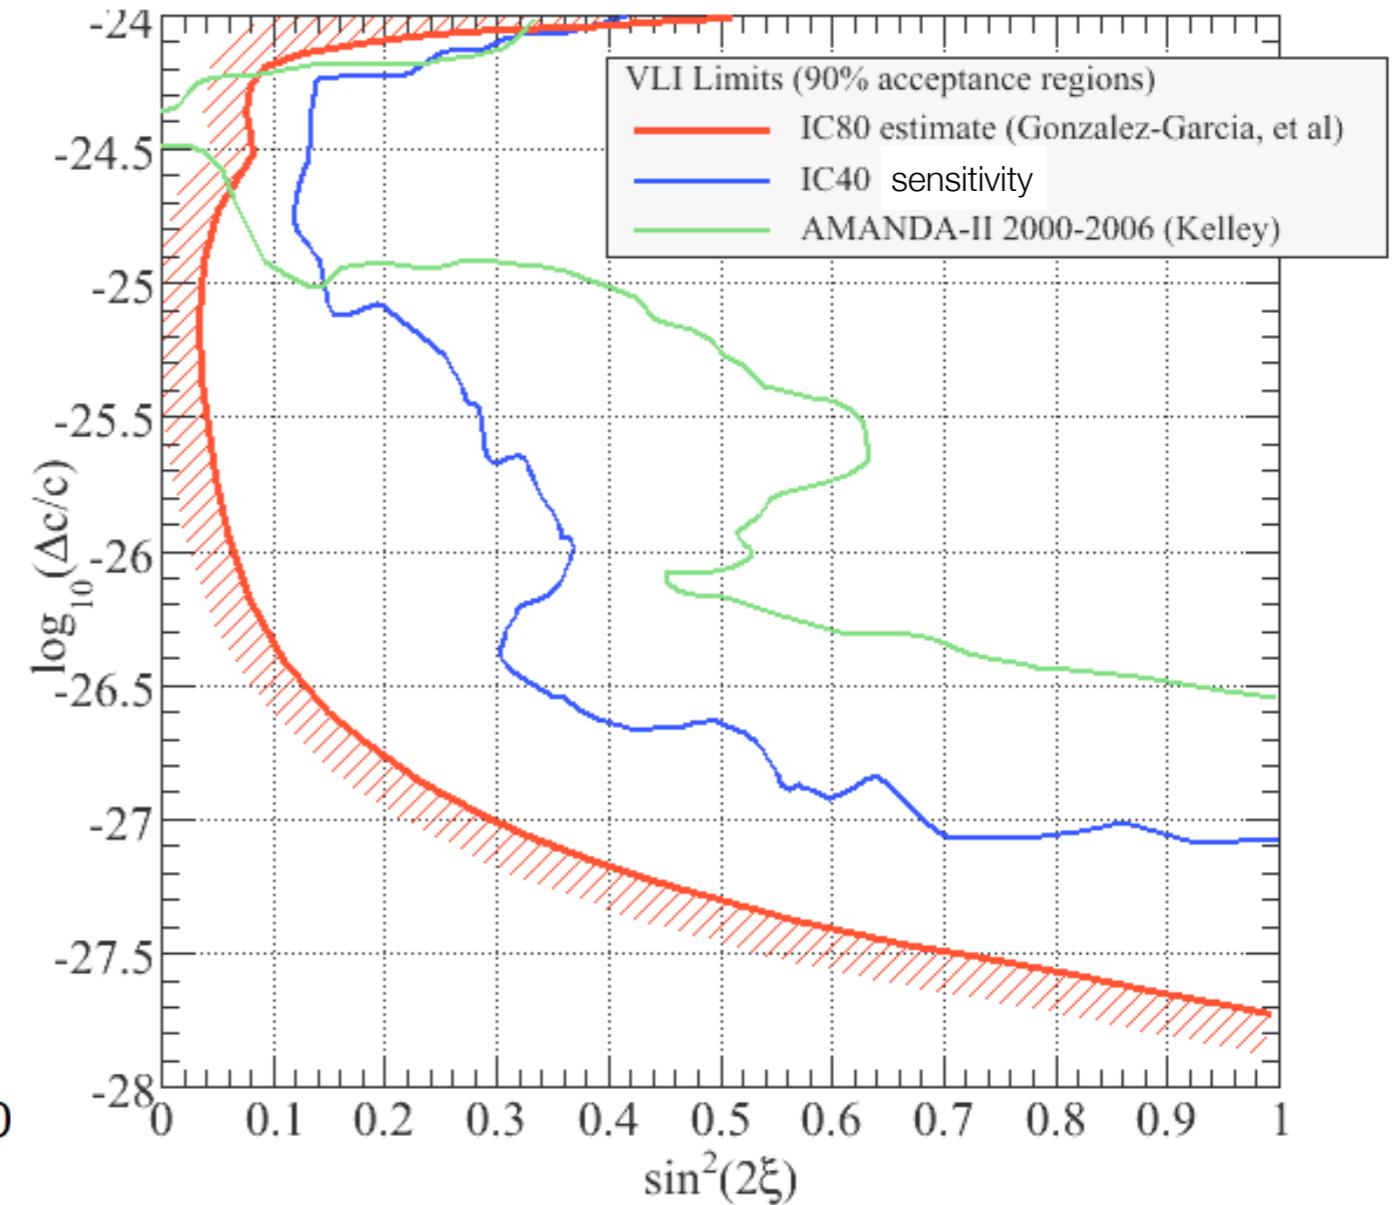

atmospheric neutrinos & non-standard oscillations

Abbasi et al., Phys. Rev. D 79, 102005 (2009), arXiv:0902.0675

Violation of Lorentz Invariance

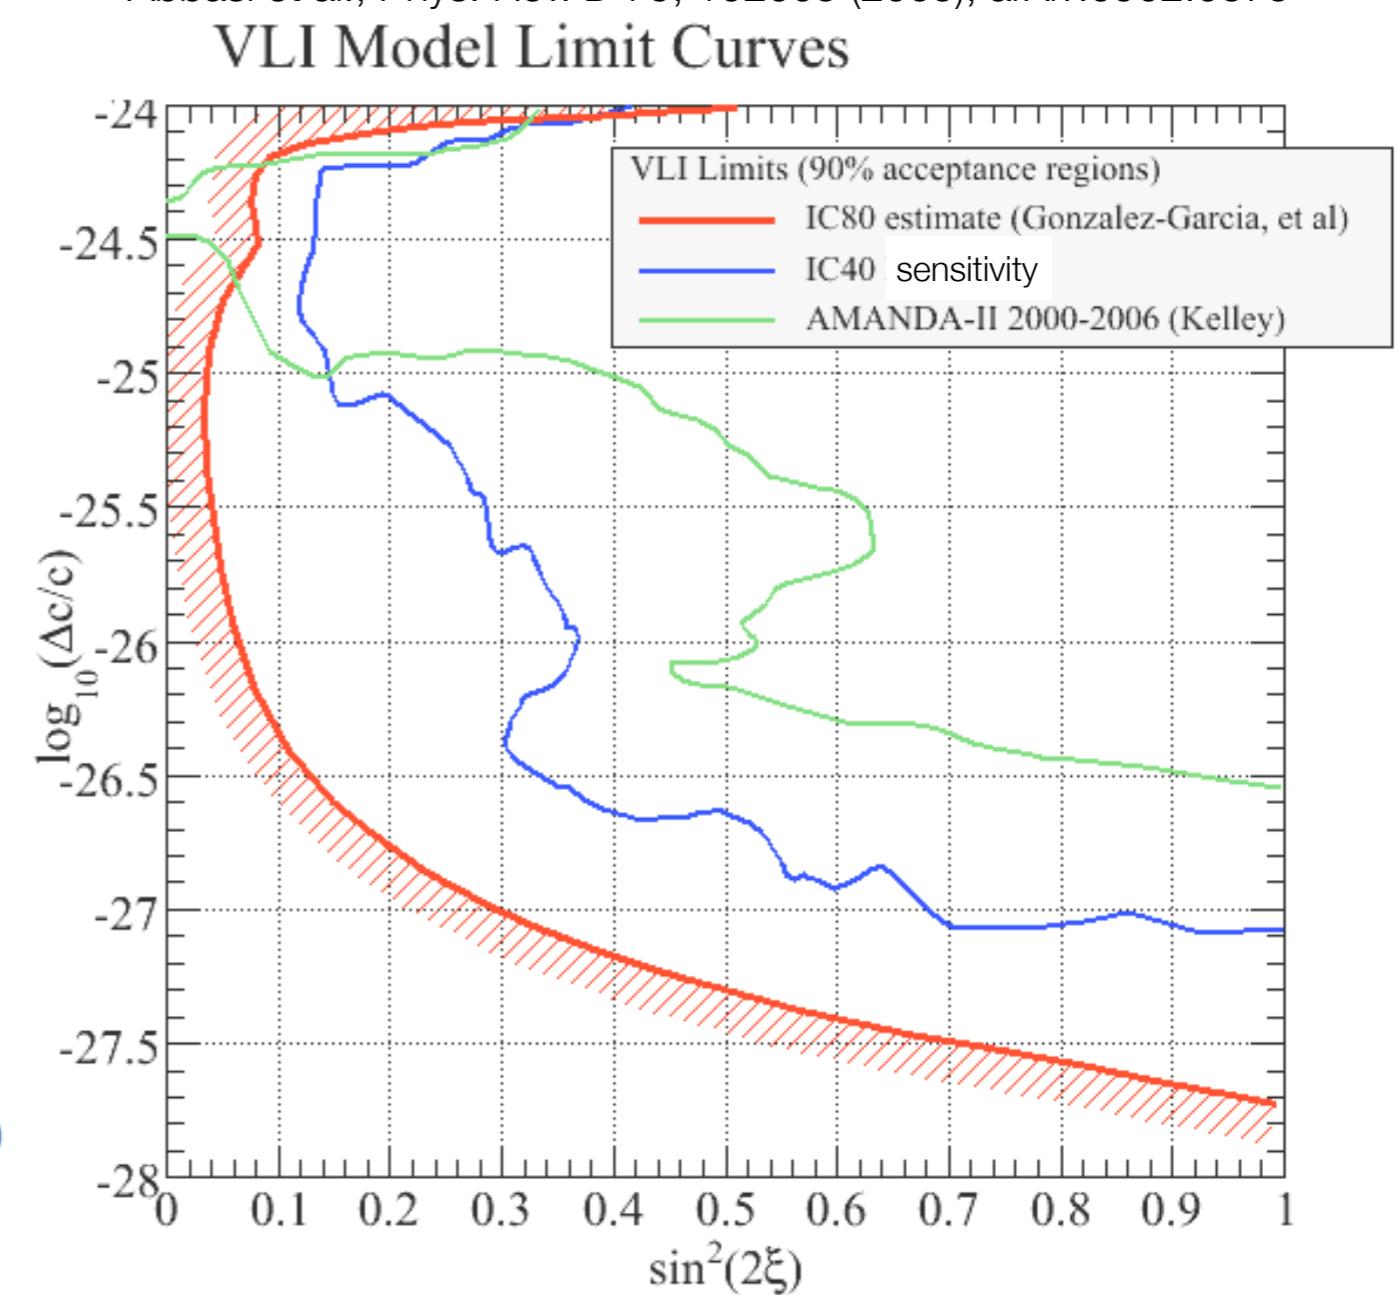

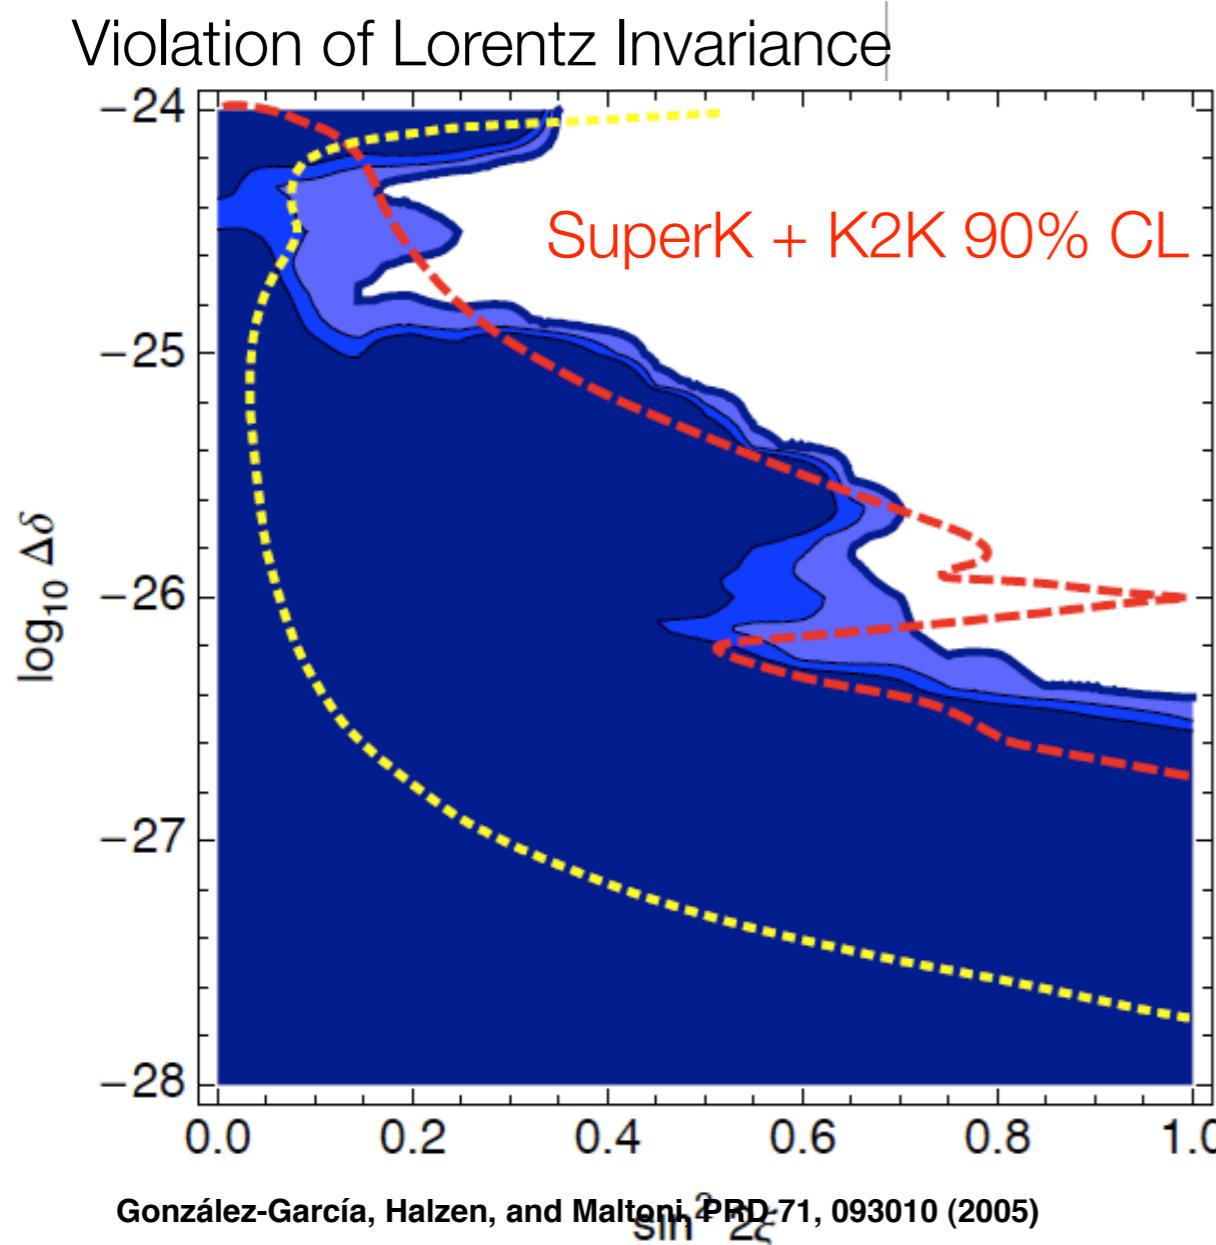

VLI Model Limit Curves

atmospheric neutrinos & non-standard oscillations

Abbasi et al., Phys. Rev. D 79, 102005 (2009), arXiv:0902.0675

atmospheric neutrinos & non-standard oscillations

- ▶ Vector Model
- ▶ violation of rotational invariance of standard interaction coefficients
- ▶ oscillations as a function of E_ν , L and direction

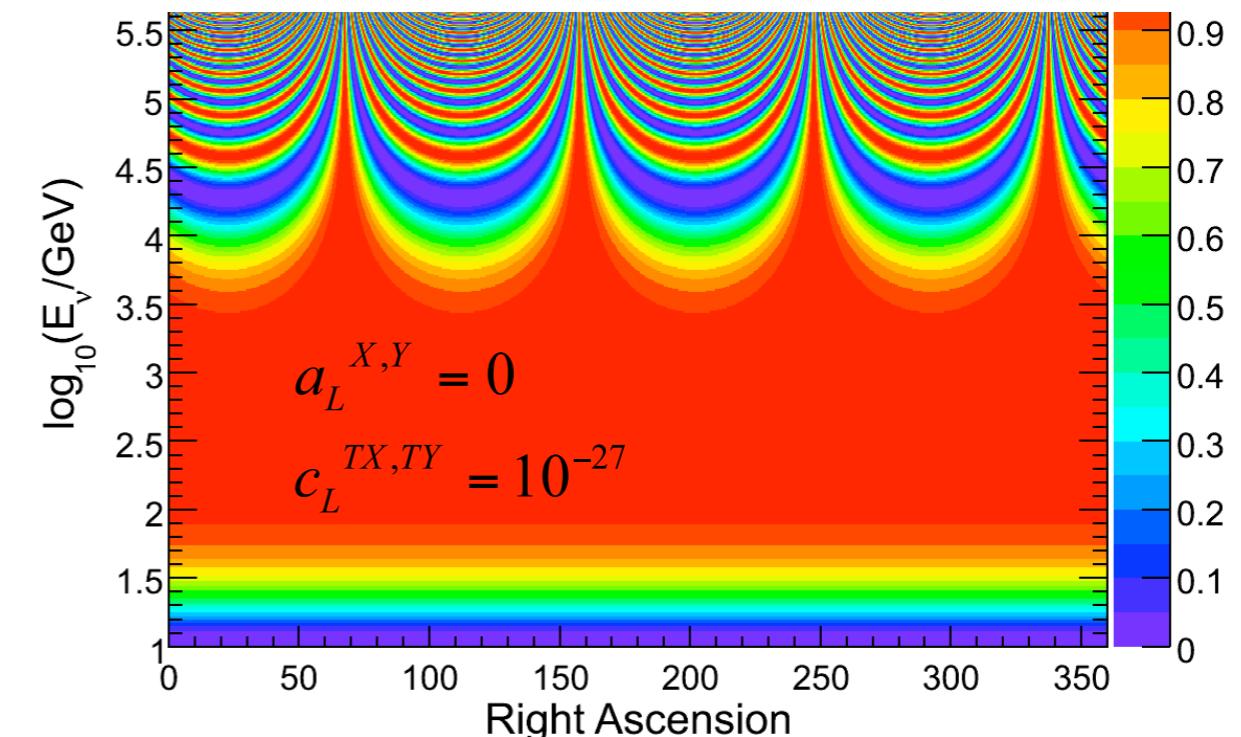

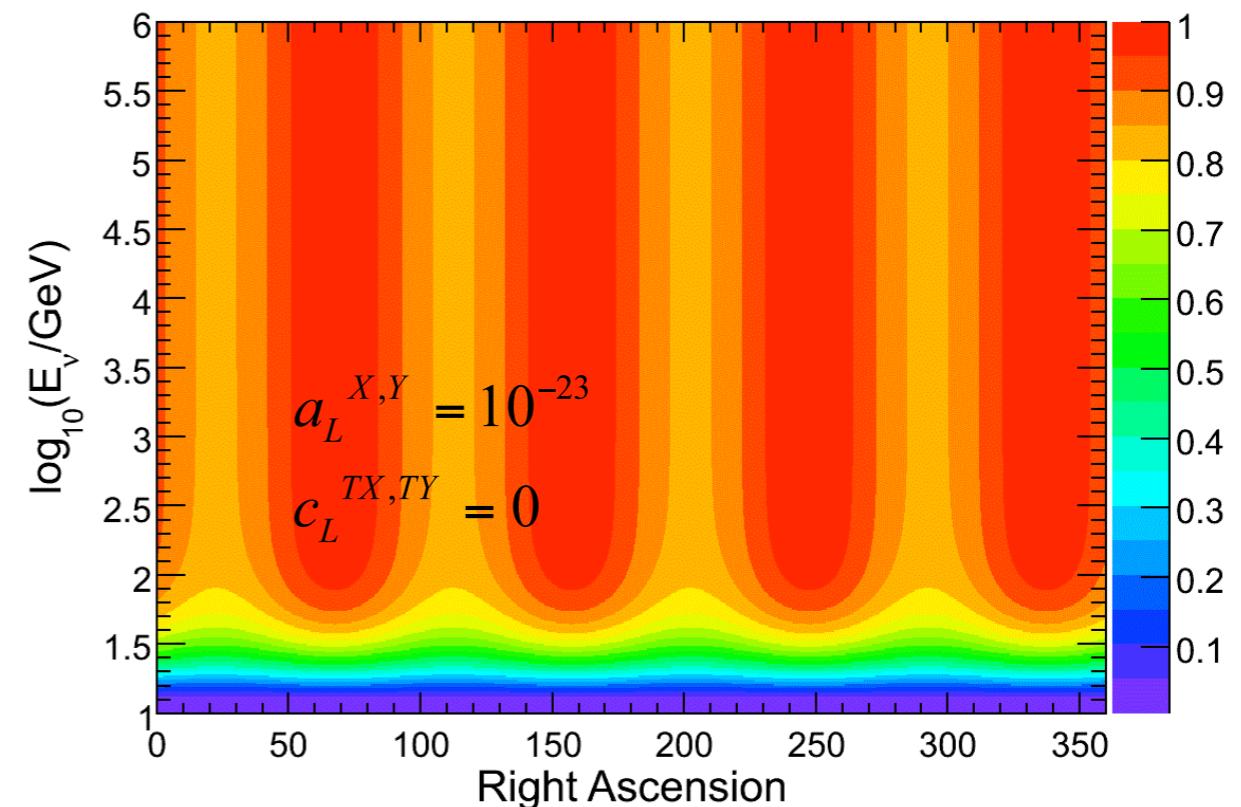

preliminary

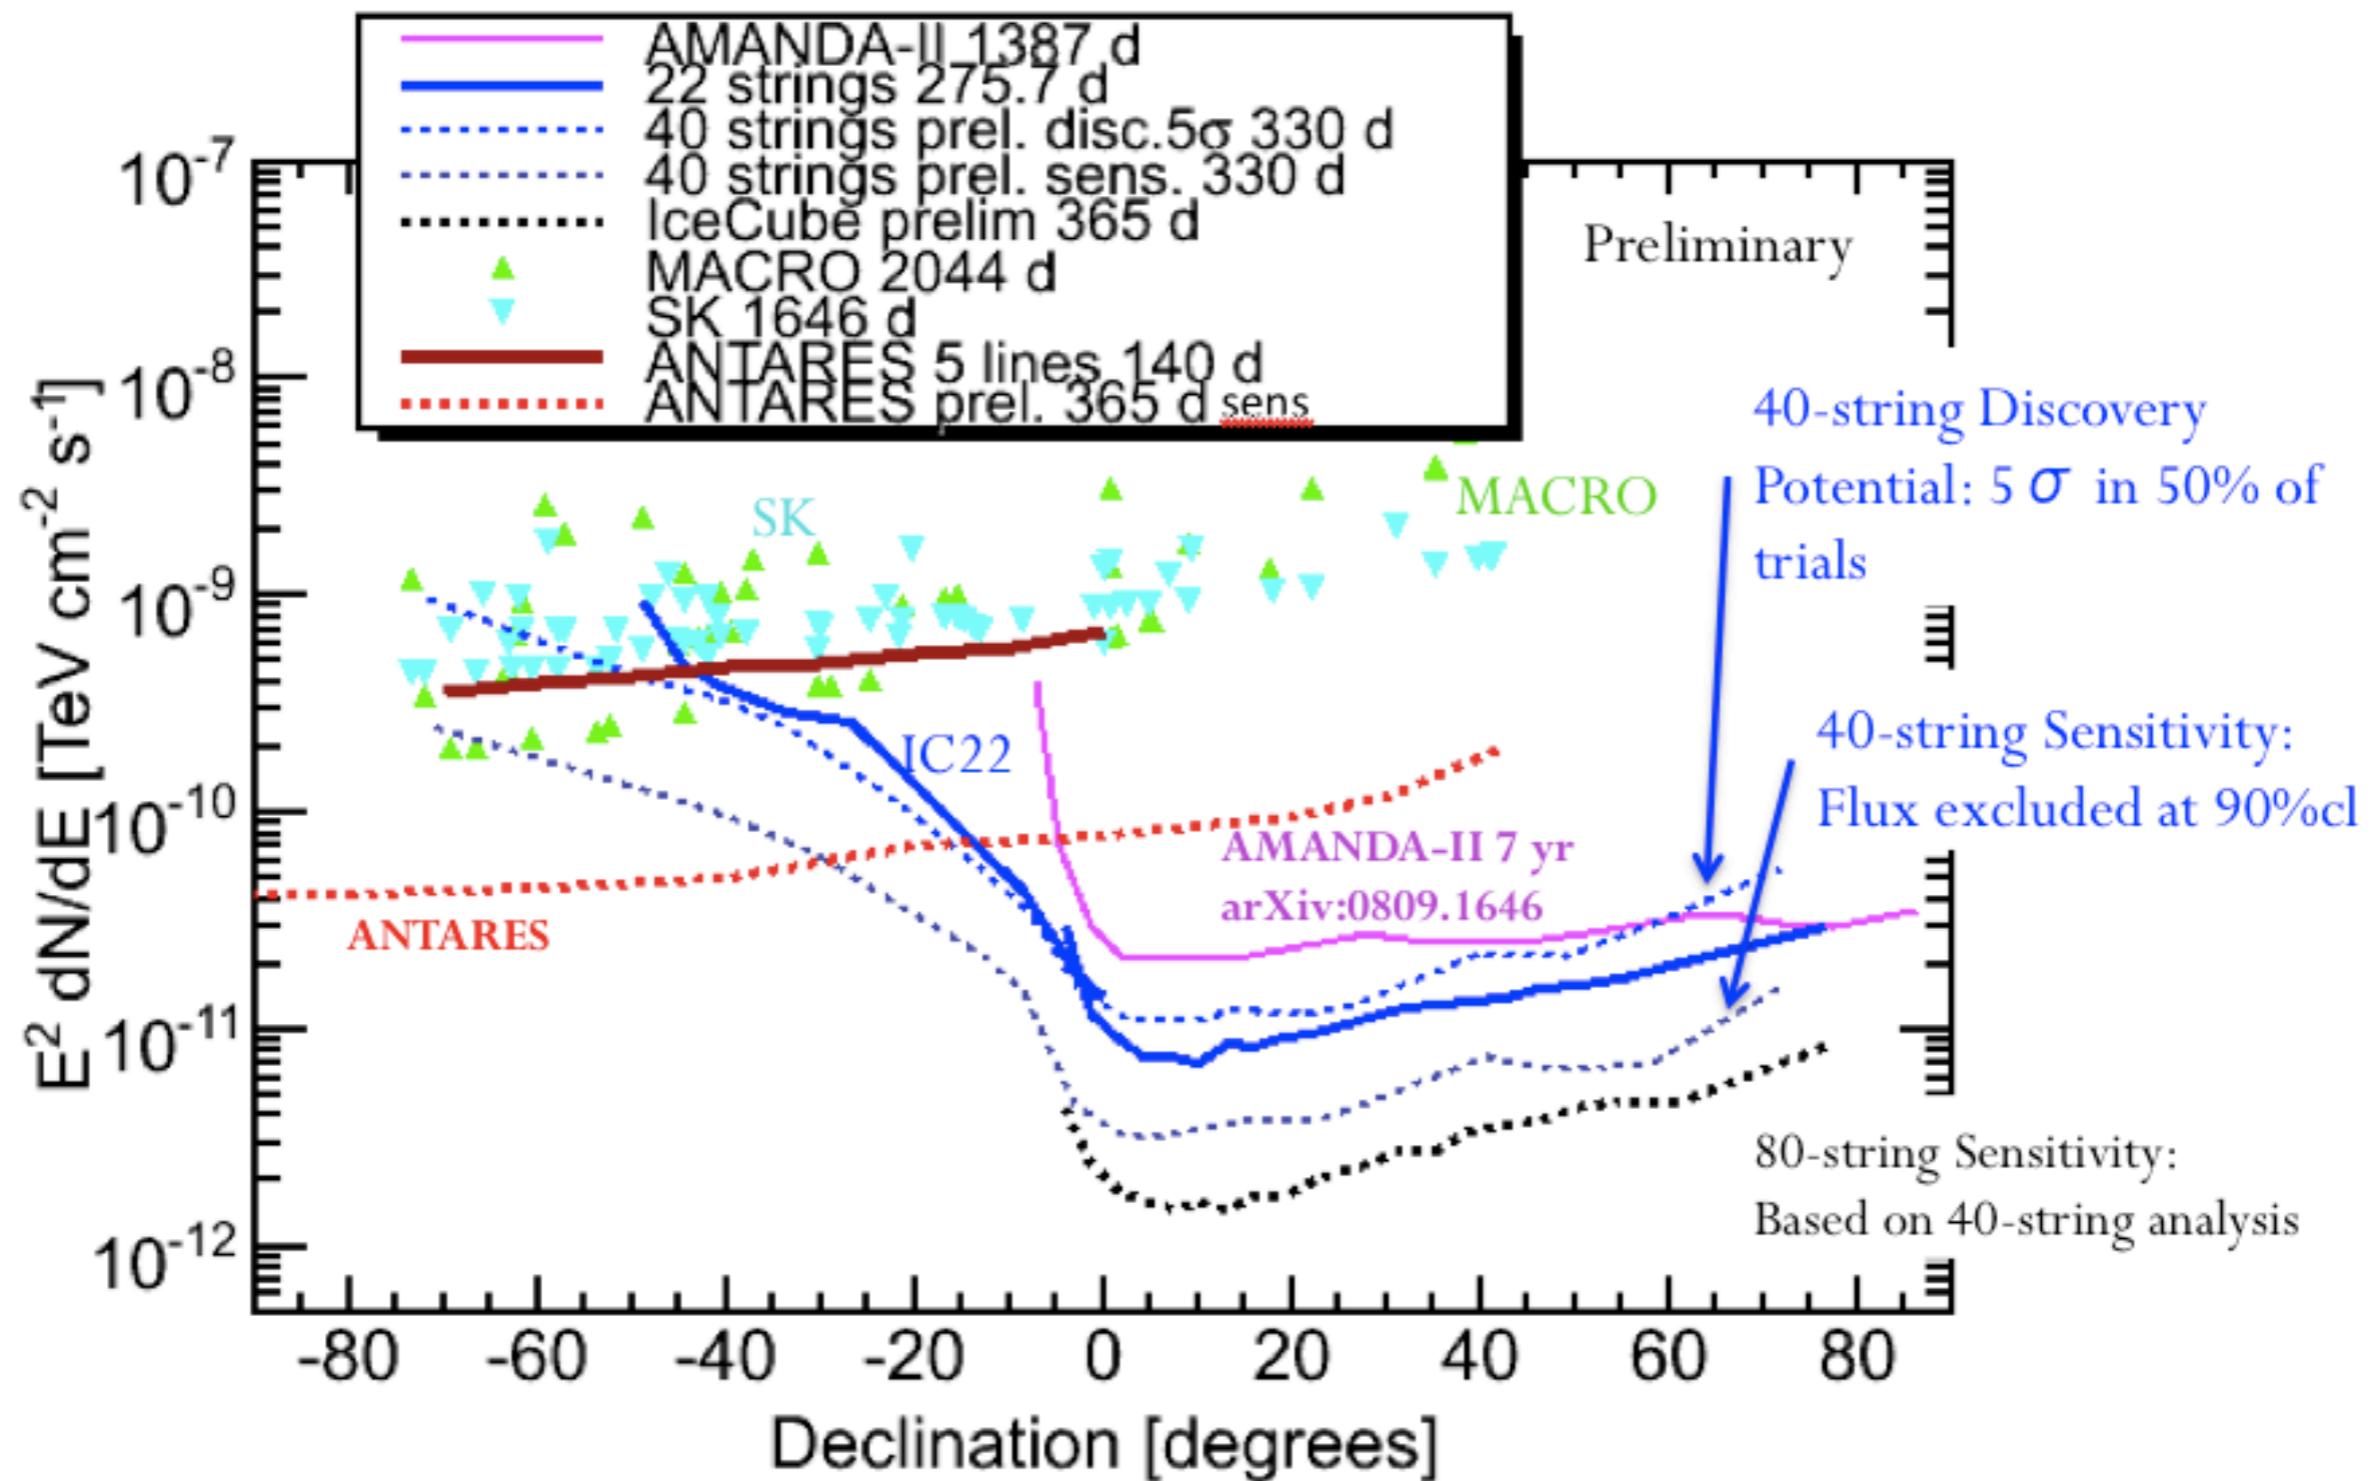

IC40:

$$a_L^{X,Y} < 1.3 \times 10^{-23}$$

$$c_L^{TX,TY} < 2.5 \times 10^{-27}$$

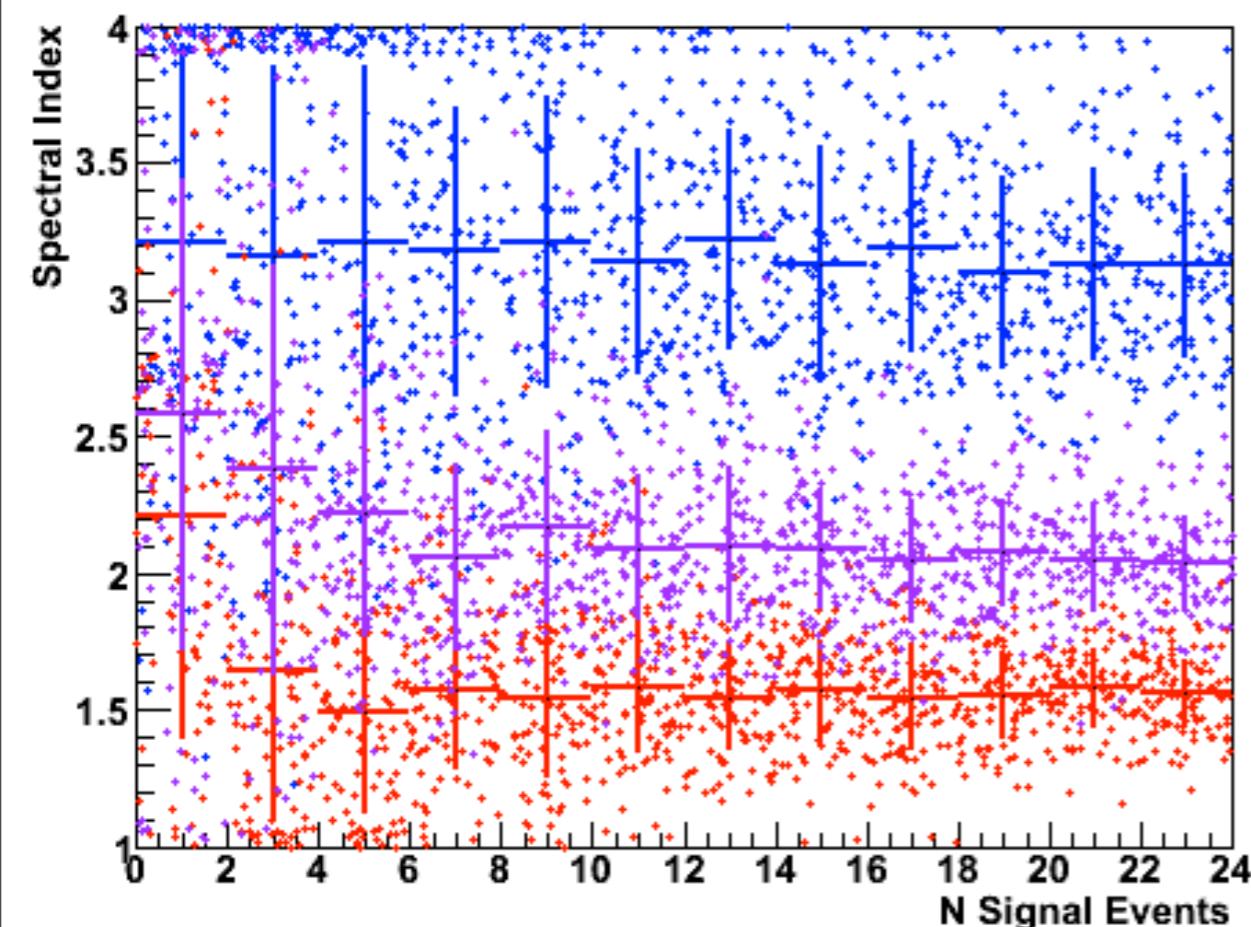

González-García, Halzen, and Maltoni, PRD 71, 093010 (2005)

comparison with limits
from γ ray detection

arXiv:0912.0742

improvement expected with Deep Core (low energy extension)
& with further event selection optimization (@ lower energy)

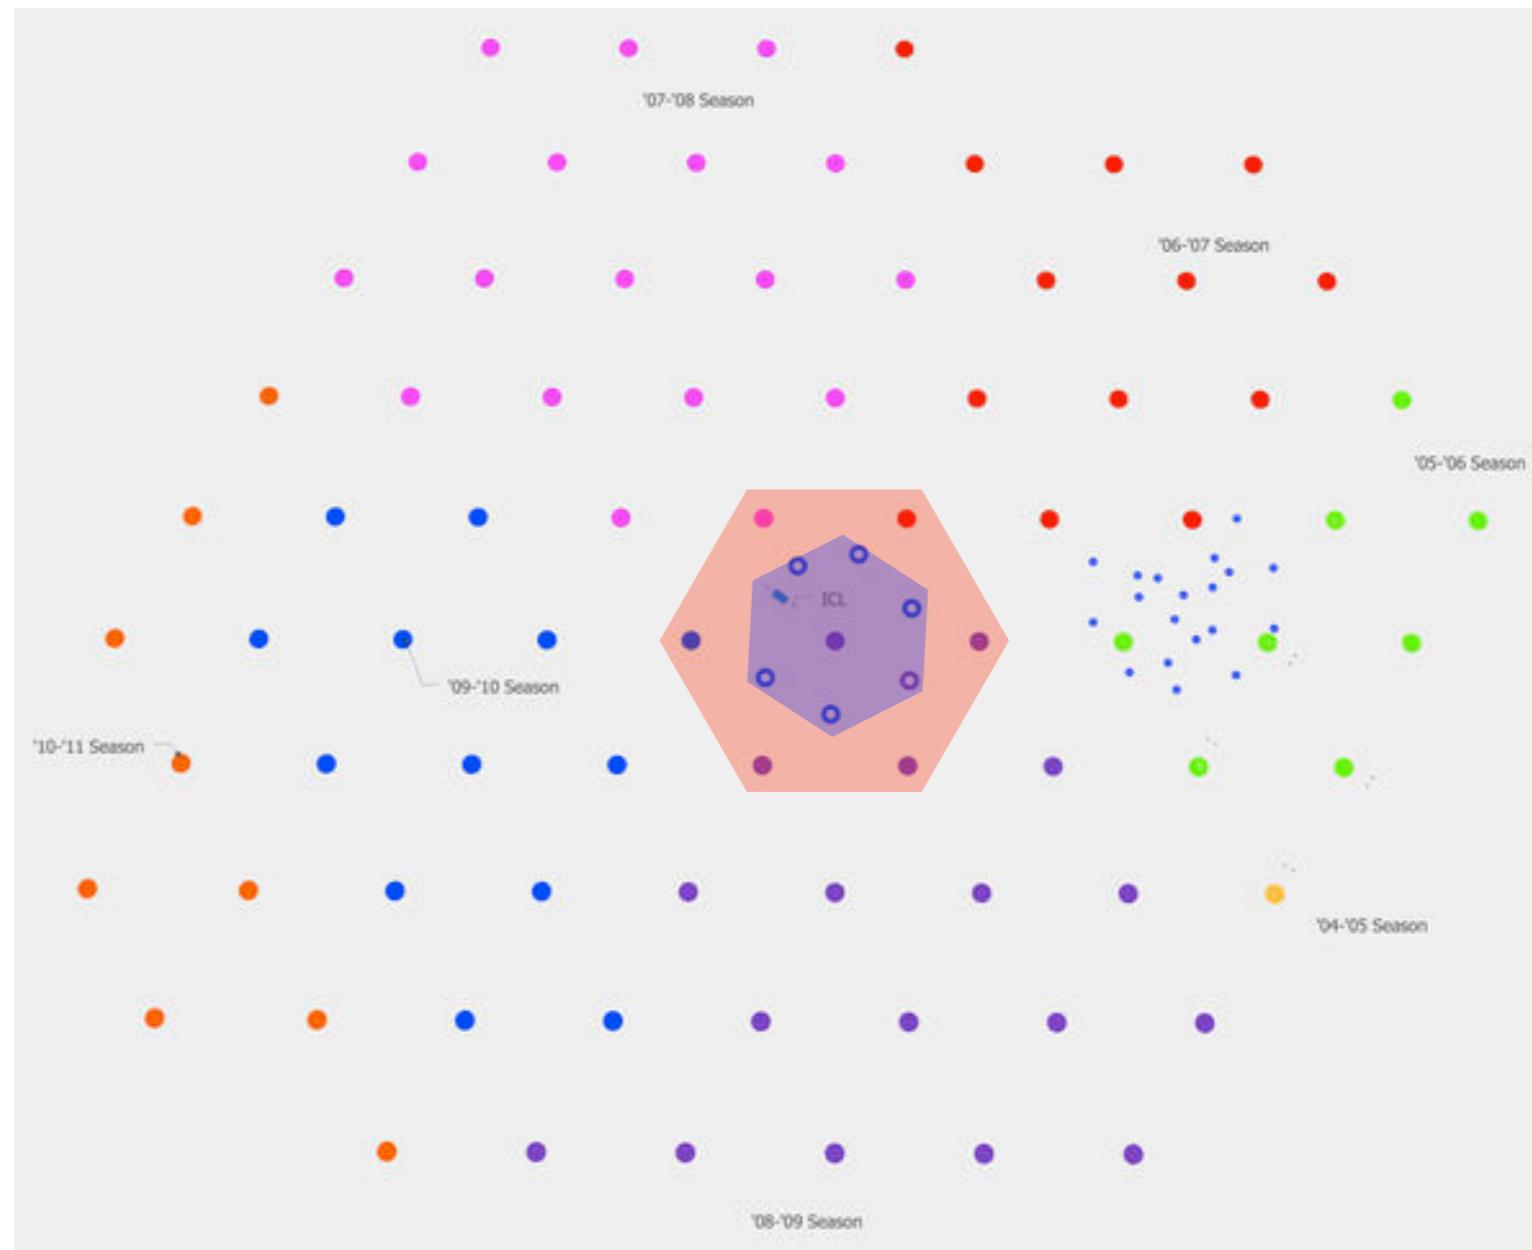

Deep Core from above

- 6 strings with hi QE PMT

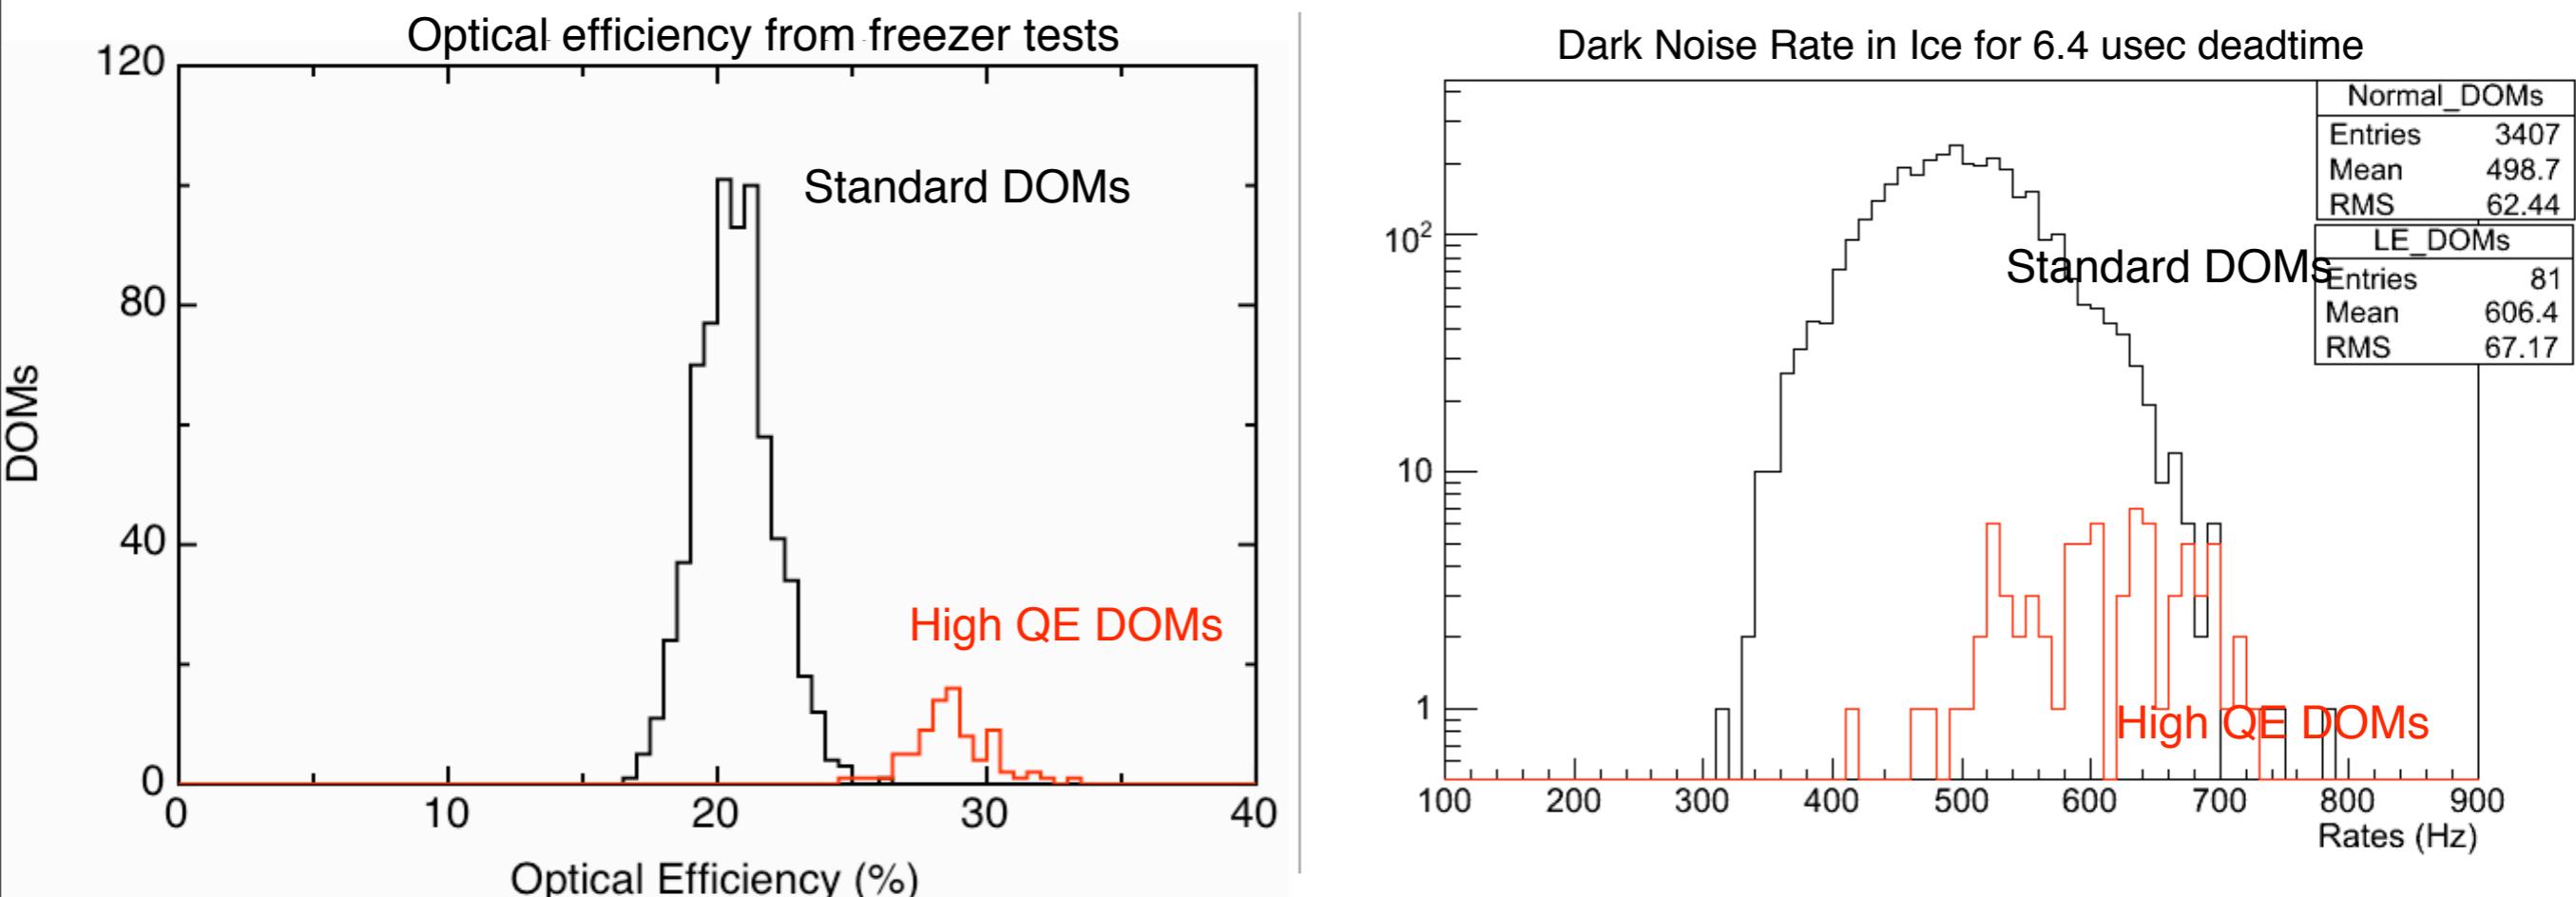

- ▶ 60 DOMs/string

- 7 surrounding IceCube strings

- ▶ 22 DOMs in DC range

Deep Core PMT's

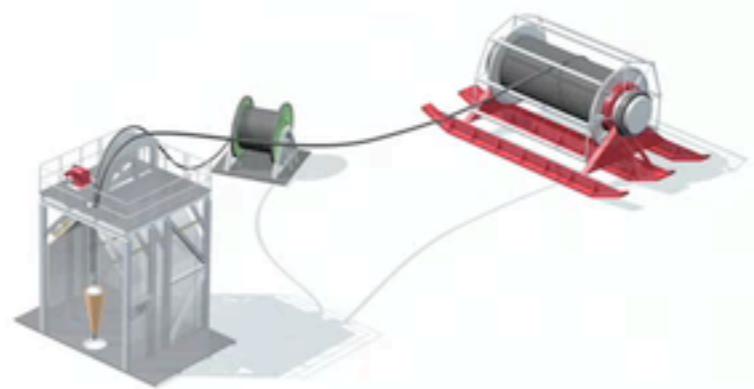

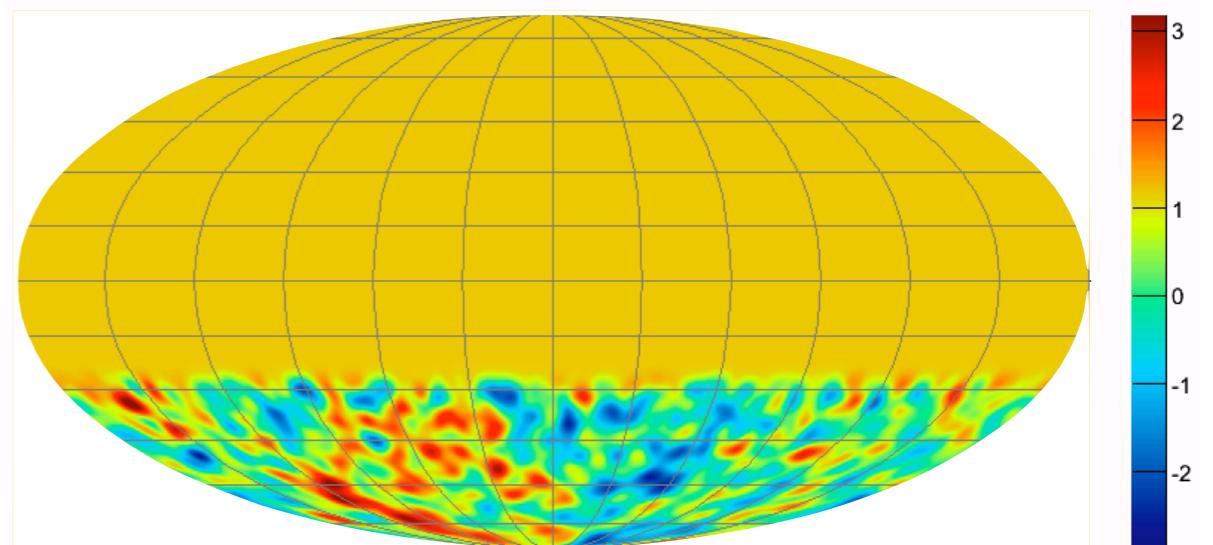

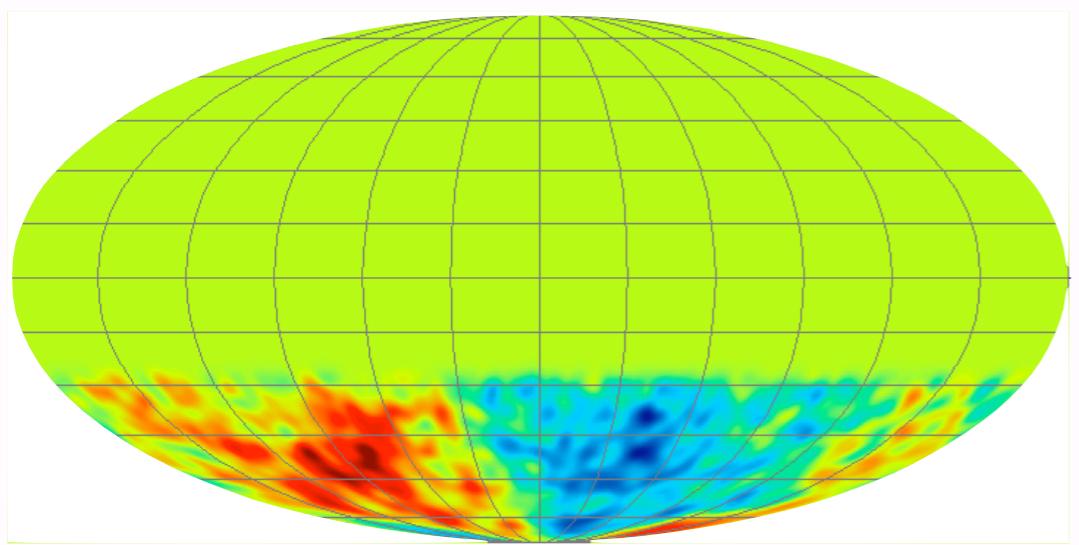

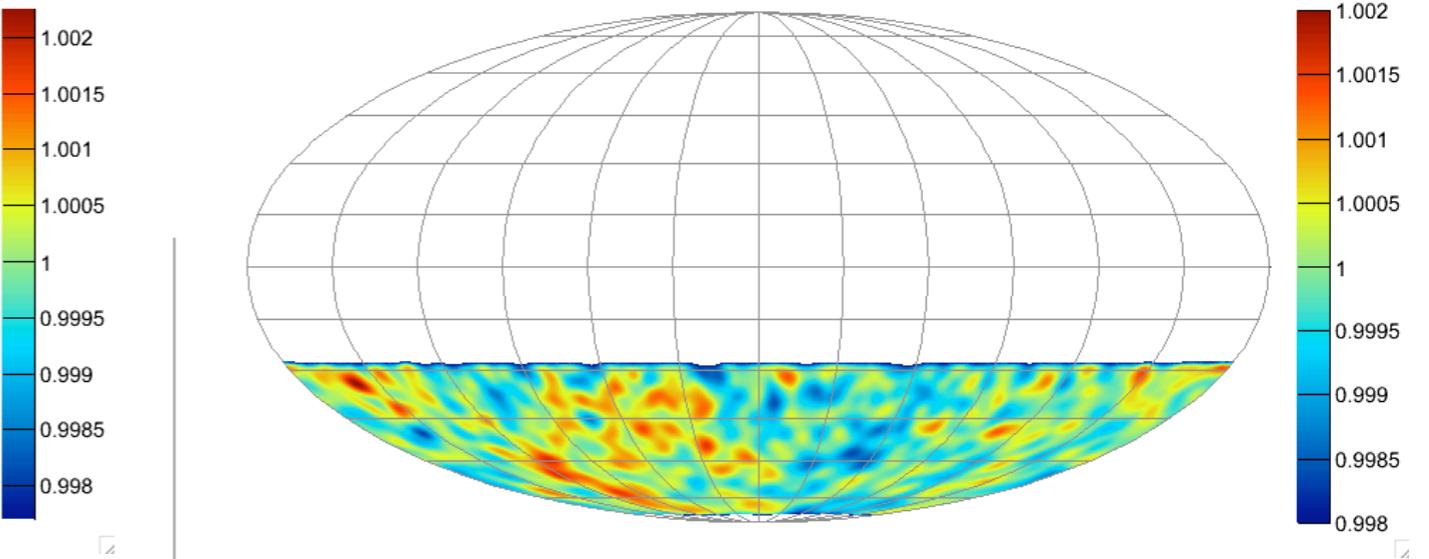

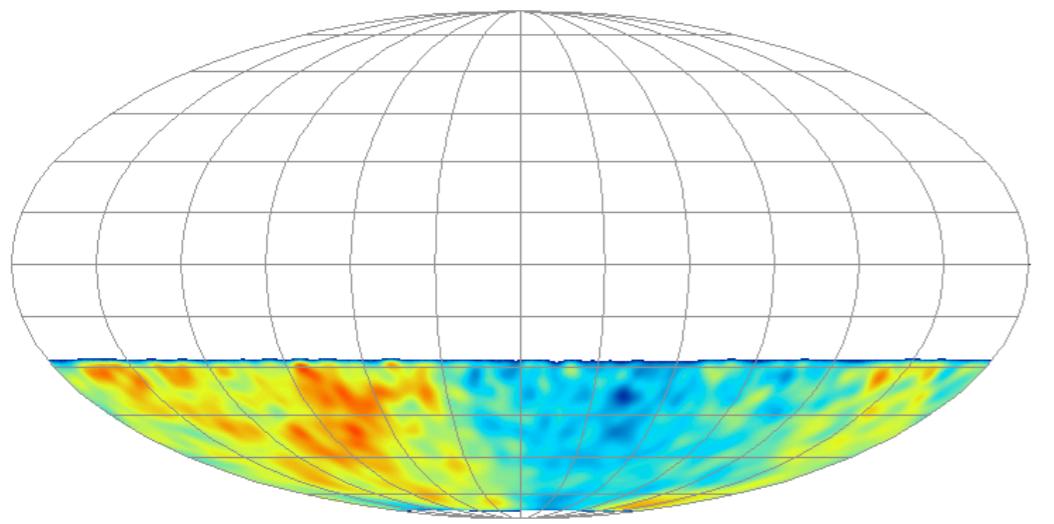

- quantum efficiency ~38% higher (405 nm, -40C), ~ 30% higher noise rate in ice.
- low temperature (-40°C) noise behavior scales with quantum efficiency as expected.

Deep Core (animation)

drill (animation)

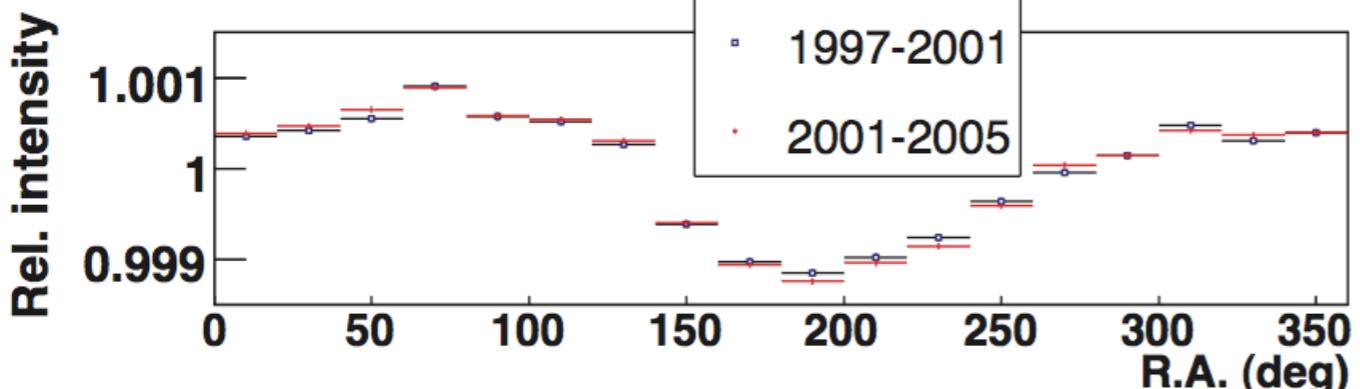

$E_{\text{median}} = 12 \text{ TeV}$

$E_{\text{median}} = 126 \text{ TeV}$

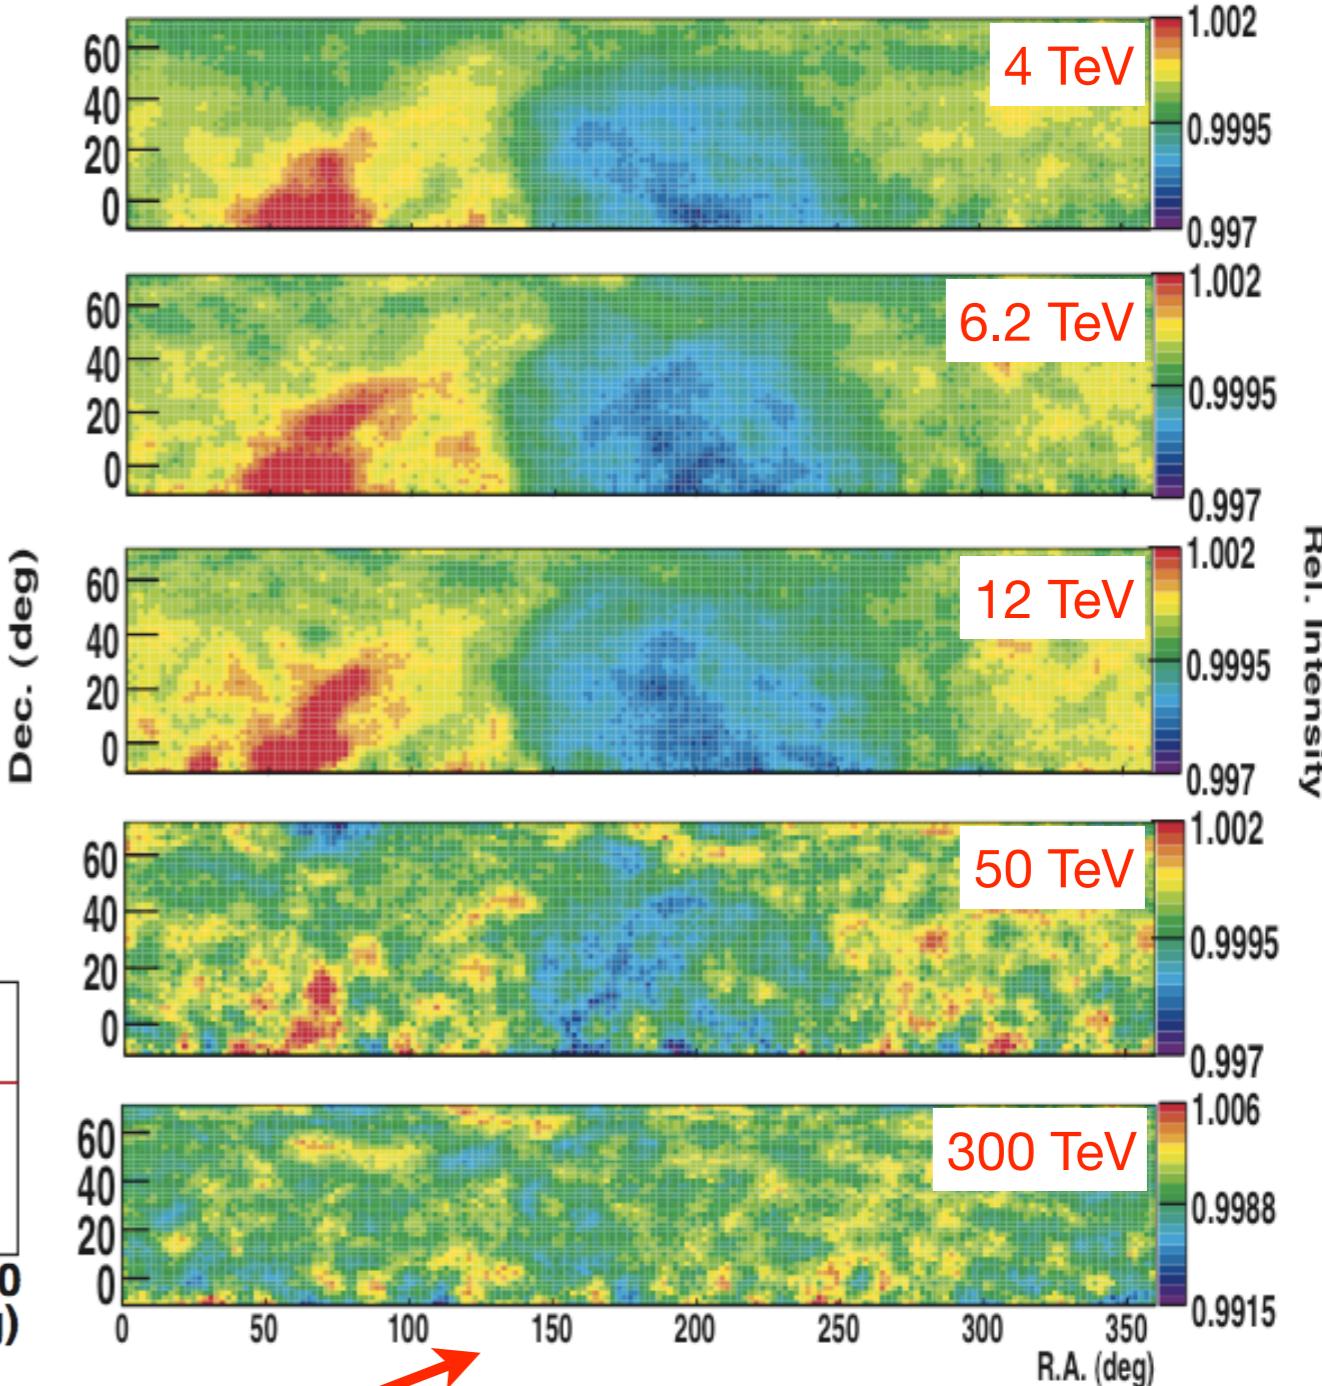

IceCube-22 : significance
Rasha Abbasi

- ▶ data from 1997 to 2005
- ▶ 1874 days livetime
- ▶ $3.7 \cdot 10^{10}$ events
- ▶ angular resolution $\sim 0.9^\circ$
- ▶ modal CR energy ~ 3 TeV

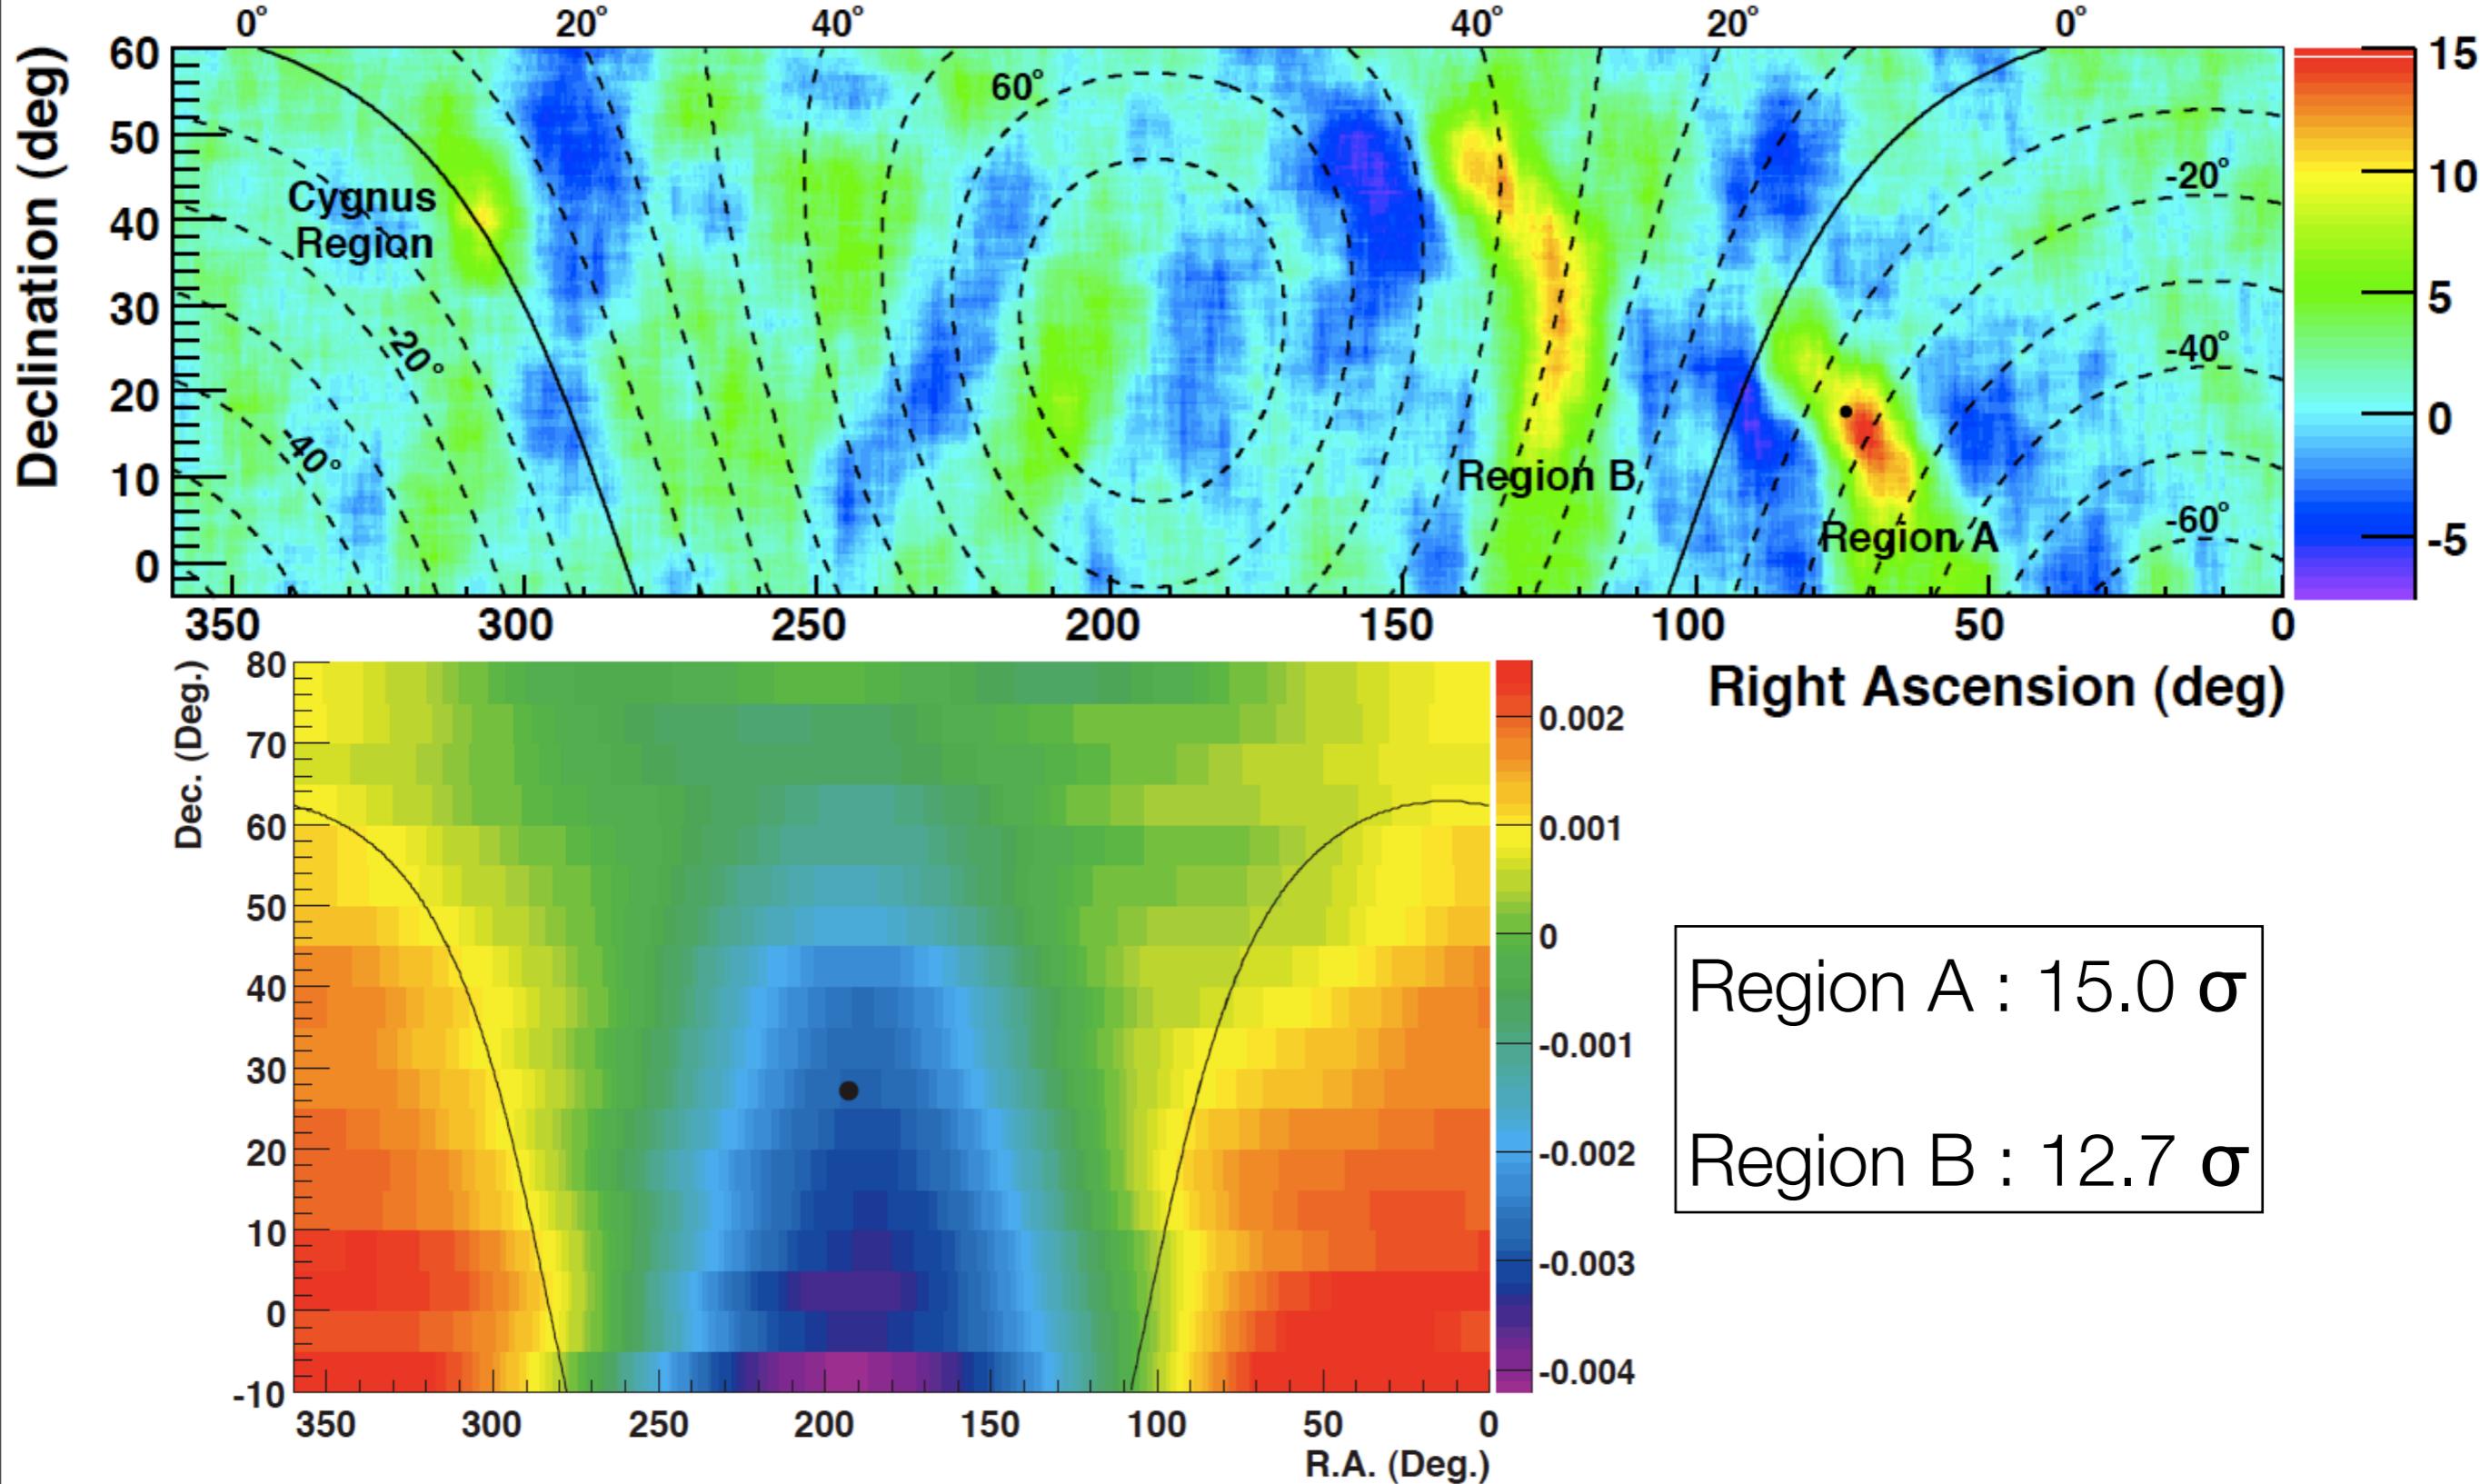

anisotropy seems to disappear :
co-rotation of cosmic rays ?
