

# Electrical Wiring in DFL and Related Issues

**December 2003  
Madison Workshop**

**Nobuyoshi Kitamura**

**UW-Madison**

# Objective

Copper wiring of the **Dark Freezer Laboratory** setup for DOM test and calibration.

→ Data / Power connection between HUB (DOR cards) and DOMs.

→ Local Coincidence (LC) connections between DOMs.

The RAPCAL function will be relied on for the test and calibration.

→ Data / Power connections must be compatible with RAPCAL.

# Dark Freezer Lab (DFL)

TOTAL  
78 boxes x 4 OMs/box  
312 OMs

 = 1 OM (Optical Module)

21 boxes x 4 OMs/box  
84 OMs

36 boxes x 4 OMs/box  
144 OMs

21 boxes x 4 OMs/box  
84 OMs

# Generic Wiring Scheme

Constraint: One Junction Box per DOR connection (DB9)

Alternatively, "One box per DOR card".  
Use the above as a design constraint.

# Junction Box Circuitry

- ❑ Power/Data connection to DOMs
  - ❑ LC connection between the DOMs
  - ❑ LC connection to the neighboring Junction Boxes
  - ❑ Adjust signal attenuation
  - ❑ Adjust signal rise-time
  - ❑ Impedance matching (if necessary)
- } Emulate a long cable > 250m  
for RAPCAL

Signal amplitude at source is fixed: 1.2Vpp  
Receiver ADC samples at 20MHz  
Receiver ADC dynamic range: 400mVpp  
K.H.Sulanke estimates a minimum of 250m cable length for RAP cal.

# Local Coincidence Wiring

**Requirement???: All LC cables must be of the same length.**

If this is a true requirement, accommodating the slack of LC wires becomes an issue. Can a circuitry inside Junction Box accomplish the same?

Same length as the distance between Junction Box neighbors

## Data/Power Cable (DOR/HUB – DOMMB Cable) Options

**Requirement: The cables must be shielded.**

- EMI-clean environment inside DFL
- Cross-talk management

Quad vs. Twisted Pair??

- Quad cables are difficult to handle (stiffness, bending radius)
- Quad cables have matched impedance for DOR and DOMMB (145  $\Omega$ )
- DOR card assumes Quad per DB9 connector
  
- Twisted pairs are available in many varieties
- Matched impedance variety must be custom made.

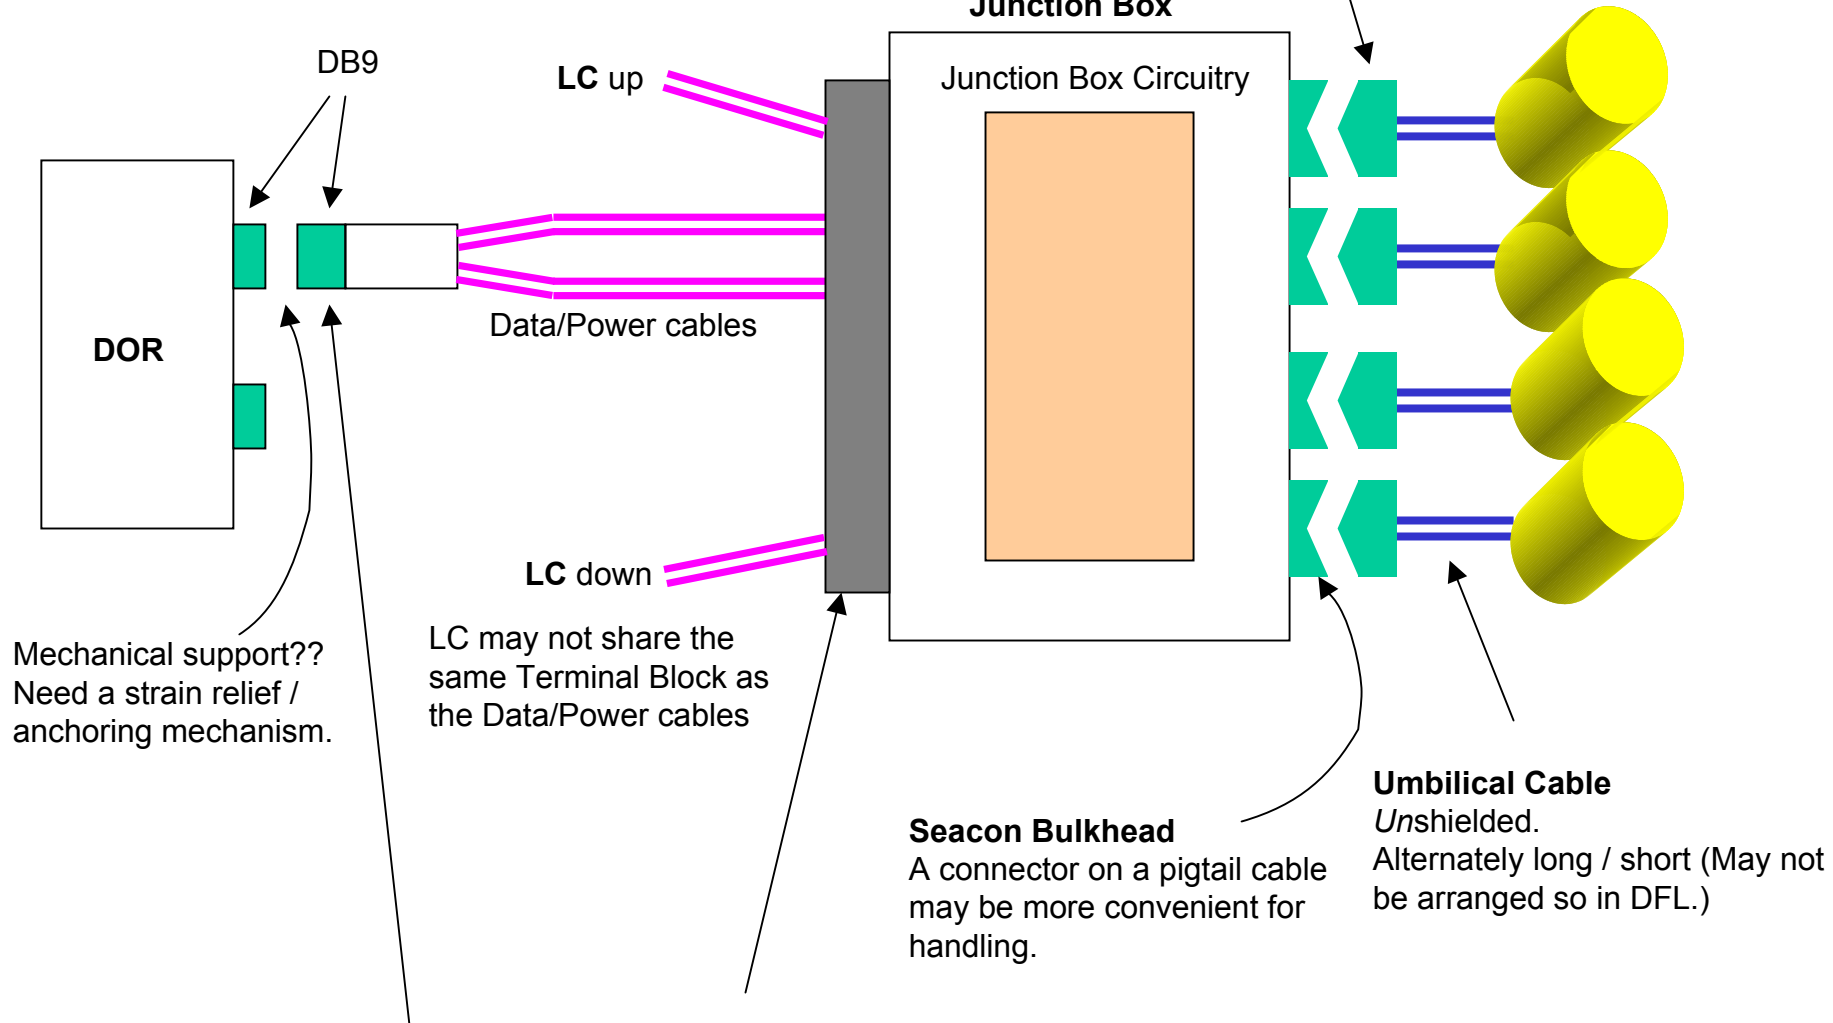

**Custom twin twisted-pair** (Two shielded, stranded, 145 $\Omega$ , twisted-pair cables packaged in one) is most convenient.

# Wiring with **Shielded Twisted Pairs**

(The shield connections are not shown.)

Mechanical support??  
Need a strain relief /  
anchoring mechanism.

LC may not share the  
same Terminal Block as  
the Data/Power cables

**Seacon Bulkhead**  
A connector on a pigtail cable  
may be more convenient for  
handling.

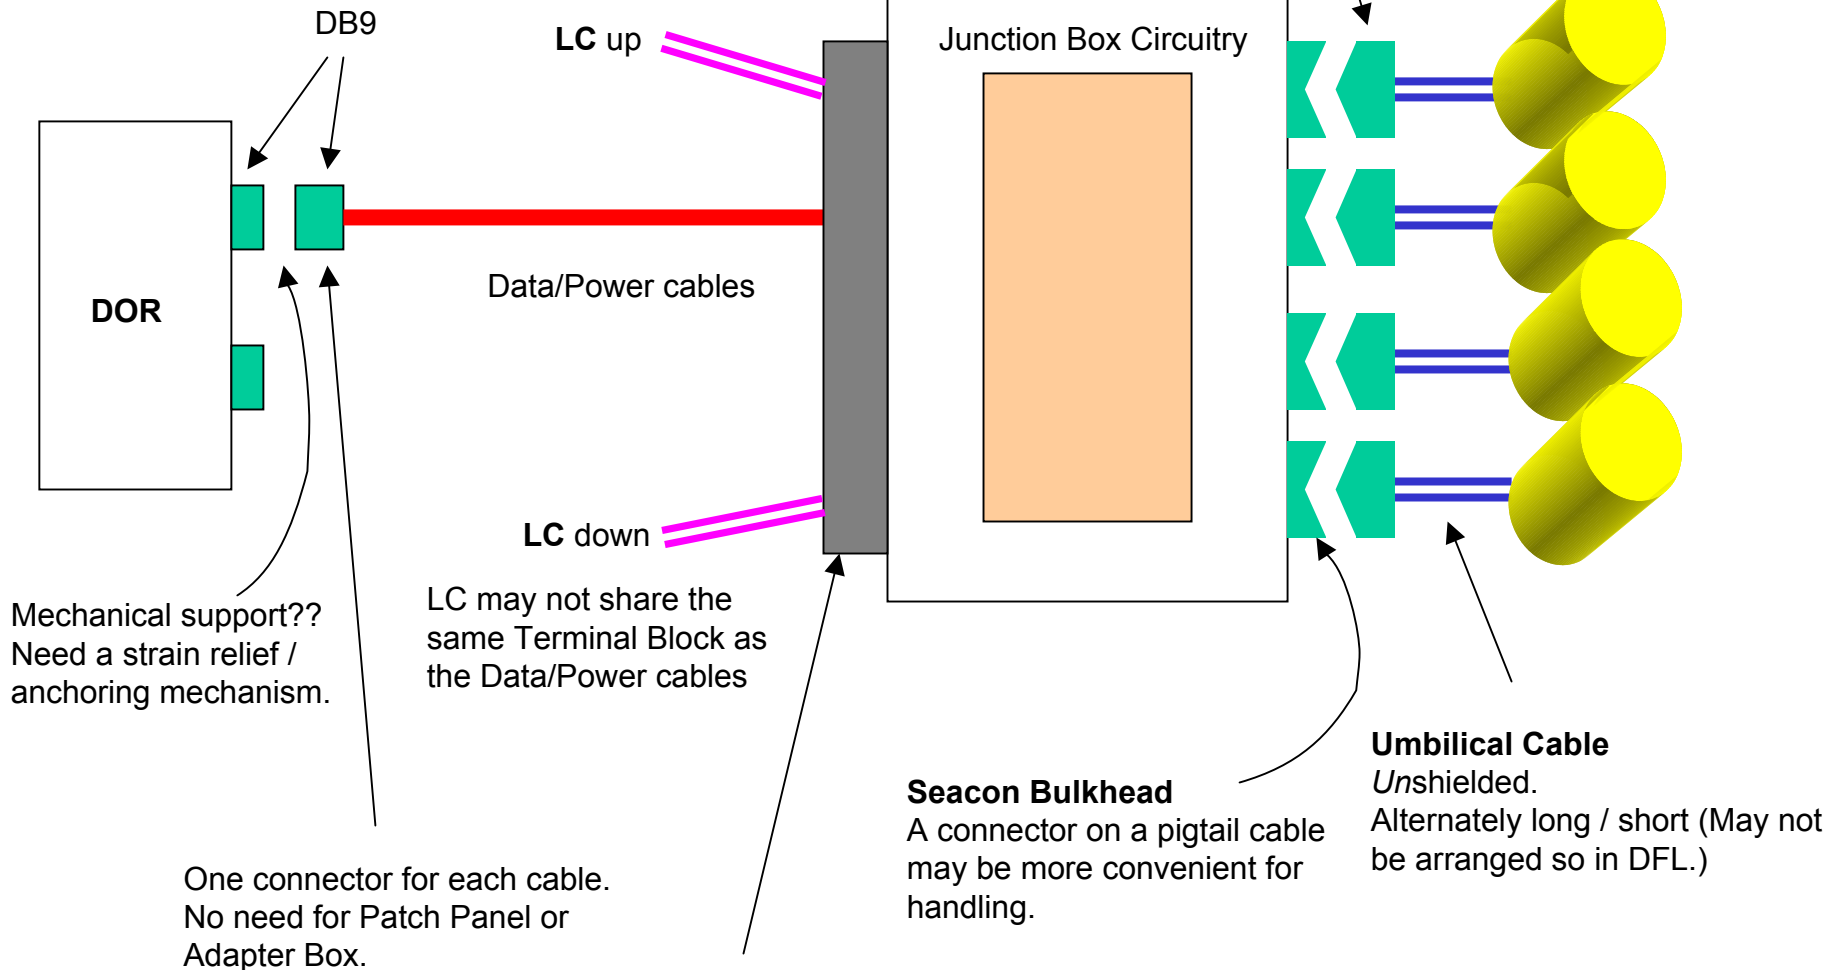

**Umbilical Cable**  
Unshielded.  
Alternately long / short (May not  
be arranged so in DFL.)

How do we combine the two pairs?  
**Patch Panel vs. Adapter Box**  
The Breakout Box could contain  
functional components

**Terminal Block vs. Connectors**  
Threading thru the DFL wall would be easier w/o connectors  
Attaching connectors after routing the cables may not be easy

# Alternative: **Twin Shielded Twisted Pairs (Quad)**

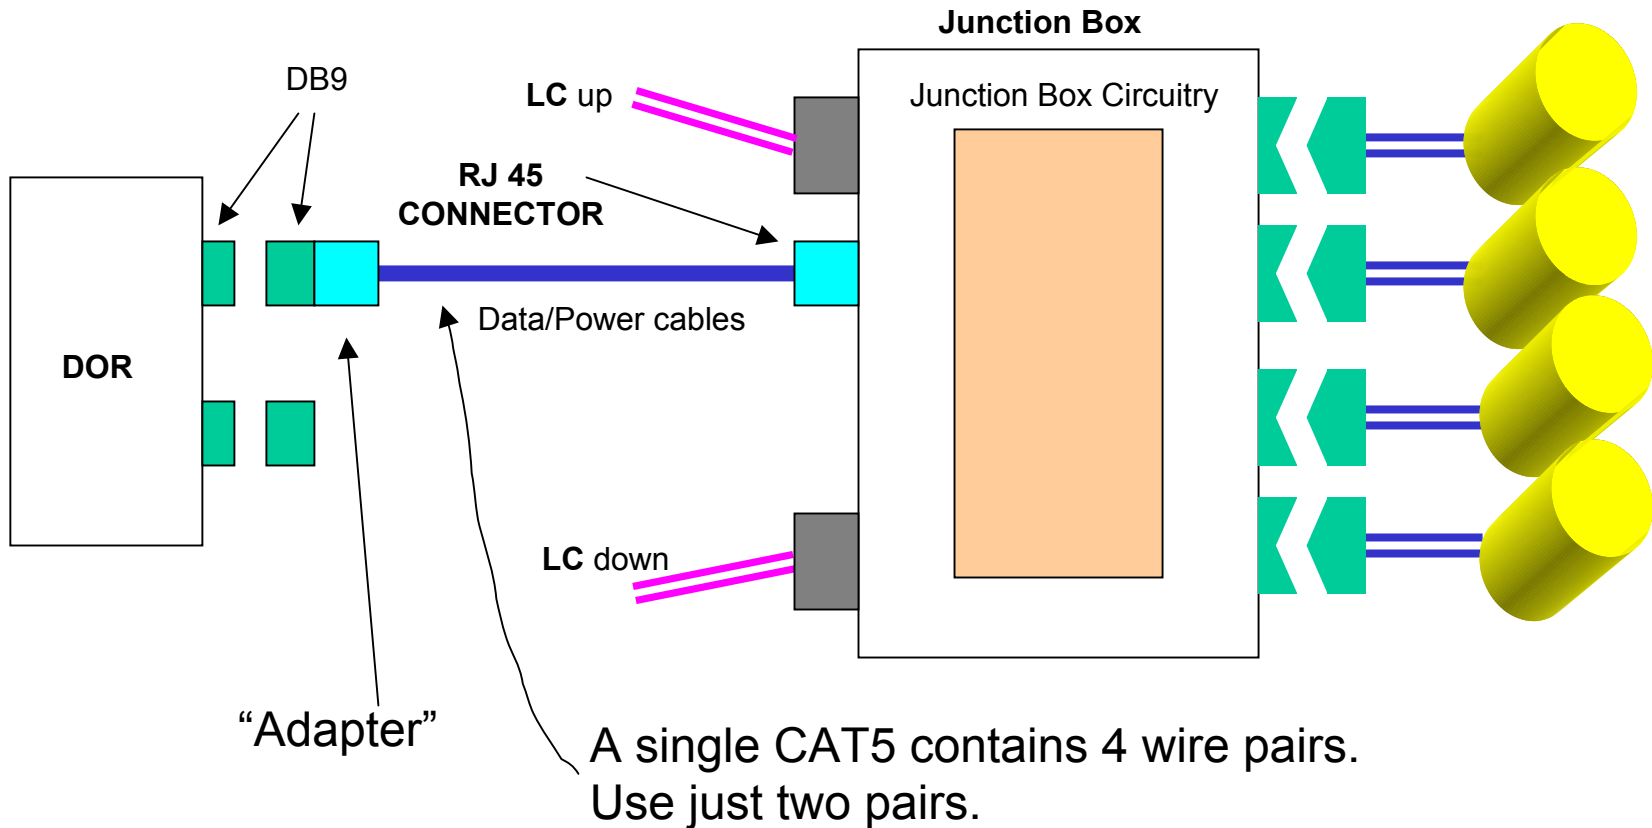

(The shield connections are not shown.)

## Terminal Block vs. Connectors

Threading thru the DFL wall would be easier w/o connectors  
Attaching connectors after routing the cables may not be easy

## Alternative: **Shielded Category 5 (CAT5) cable**

- Lab measurements show that pair-to-pair and cable-to-cable xtalk is acceptable. (A. Laundrie)
- Convenient connectorized solution.
- Needs impedance matching network.

## Proposed Solution

- ❑ Junction Box should support all three types of cabling:
  - Terminal Block for two twisted pairs or a single quad.
  - RJ45 connector for CAT5.
  - Terminal Block for the LC connections.
  - Junction Box circuitry to be replaceable / selectable
  
- ❑ CAT5 as interim solution while waiting for quad delivery.

# DOMMB / DOR Modification Proposal

- Add a low-pass filter to the communication front-end of DOMMB and DOR.
- Make the communications DAC output amplitude programmable.
  - ➔ Allow short cable for RAPCAL
  - ➔ Reduced cross-talk
  - ➔ Reduced EMI in counting house

Resource available

DOR card

Rev 3 DOMMB

Communication / RAPCAL program

Goal:

Rework / add a filter components to the boards and test COMM, RAP functionality.

Produce a report by Rev 4 deadline.
